<b>Project title</b>	Examining adverse and positive childhood experiences, and neighbourhood violent crime, as determinants of youth violence: Analyses of data from the Millennium Cohort Study
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data linkage – GEO
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	MCS
<b>Abstract</b>	This research is part of a project commissioned by The Youth Endowment Fund to CLS researchers. The overall objective is to provide evidence to better understand the risk and protective factors associated with youth offending in England and Wales, using the MCS. We aim to investigate the relationship between negative and positive childhood experiences and their potential influence on youth violence. Additionally, the role of neighbourhood crime will also be examined.
<b>Keywords</b>	Police recorded crime data

<b>Project title</b>	Coastal youth: exploring the impact of coastal towns on young people's life chances
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data linkage – GEO
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	NCDS
<b>Abstract</b>	Coastal towns in England and Wales have experienced stark economic decline in recent decades, with residents now likely to experience multiple levels of deprivation. Despite this, little research has examined the impacts of these challenges on young people and their future prospects. Our study, therefore, questions how growing up in coastal towns shapes young people's life chances, including their likelihood of

	having good educational, employment, housing, and health outcomes in adulthood. To explore these issues and develop meaningful policy interventions to improve coastal youth life chances, we will collect and analyse longitudinal and new qualitative data across six coastal towns. Additionally, we will undertake secondary analysis of NCDS data – specifically, from a sample of 11-year-old children’s essays about their imagined lives at age 25 – to shed light on how youth opportunities, aspirations, and mobility plans have changed over time and across generations.
<b>Keywords</b>	Coastal deprivation, life course research, spatial inequalities, youth life chances, and youth mobilities

<b>Project title</b>	Dynamics of Preference and Social Geography
<b>Institution</b>	Institute for Fiscal Studies (IFS)
<b>Application type</b>	Data access
<b>Data access method</b>	UK Data Service SecureLab
<b>Cohort</b>	MCS
<b>Abstract</b>	I estimate a dynamic general equilibrium model of neighbourhood choice and immigrants' cultural assimilation using a 17-year-long micro panel dataset that includes proxy variables for immigrants' cultural traits and neighbourhood choices. Social benefit from cultural assimilation depends on cultural similarities from their neighbours. Therefore, cultural assimilation effort is jointly determined with a neighbourhood choice. Using the model estimates, I discuss how to design a rent subsidy conditional on cultural dissimilarity from their neighbours that can effectively induce immigrants' cultural assimilation.

<b>Project title</b>	Assessment of retrospective bias and validation of life history data in the English Longitudinal Study of Aging (ELSA)
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access

<b>Data access method</b>	UK Data Service SecureLab
<b>Cohort</b>	NCDS and BCS70
<b>Abstract</b>	The proposed research plans to study agreement between prospective and retrospective reports of early life and childhood circumstances in the National Child Development Study (NCDS). Comparing retrospective data with the data collected prospectively provides a unique opportunity to understand the accuracy with which early life and childhood experiences can be recalled. This information will be used to inform decisions for the inclusion of such measures in the new life history module of the English Longitudinal Study of Aging (ELSA), planned to be administered in 2023/24 (with participants who entered the study after 2006). In 2006/7, ELSA collected life history information using a Life History Questionnaire (LHQ), focusing on relationships and fertility, housing and mobility, jobs and earnings, and health. In addition to measures included in 2006/7, the new LHQ will include questions about earlier life experiences not asked previously due to limited knowledge about the accuracy with which older adults can recall information about childhood.
<b>Keywords</b>	Early life, life history, prospective, recall bias, retrospective, and validation

<b>Project title</b>	Harmonising diagnoses of health conditions across British birth cohorts
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data access method</b>	UK Longitudinal Linkage Collaboration (UK LLC)
<b>Cohort</b>	NCDS, BCS70, Next Steps, and MCS
<b>Abstract</b>	<p>Britain's five national "birth cohorts" follow people from birth until now to learn more about their lives, including their health. It can be hard for researchers to combine data from these cohorts or to compare health across cohorts because they record information about the same health problems in different ways.</p> <p>Our goal is to use information from these birth cohorts and the healthcare system to identify people with health conditions that could make them more likely to have bad COVID-19 outcomes, and how long they have had these conditions for. In this project, we will look at cancer, heart, and blood vessel diseases, chronic breathing problems, and diabetes. We want to do this so that researchers can use these studies together and be sure these health conditions are measured and defined in the same way. We also want to understand how what people say about their health in surveys compares to their medical records.</p>

	<p>This is important information for researchers who only use survey data where health conditions are self-reported.</p> <p>Our work will make it easier for other researchers to investigate the effects of the pandemic on people.</p>

<b>Project title</b>	The association between high street accessibility and social isolation and mental health in adolescence
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data linkage – GEO
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	MCS
<b>Abstract</b>	<p>Loneliness and social isolation are associated with poor mental health. Young people are the age group most affect by loneliness and social isolation. The UK government's Tackling Loneliness Team have noted the lack of evidence specifying which features of young people's local areas influence their likelihood of suffering from loneliness and social isolation. This hampers wider efforts to understand the links between features of young people's local areas, social isolation, and loneliness (and consequently, their mental health).</p> <p>This project aims to link national spatial data describing young people's local surroundings, though linkage of built environment variables – with a focus on high street accessibility – to survey data from the Millennium Cohort Study. We will investigate the association between high street accessibility in childhood and social isolation in cohort members. We will also subsequently examine the relative contribution of high street and green space accessibility on young people's social isolation, while controlling for other relevant demographic and person related characteristics.</p>
<b>Keywords</b>	High streets, social isolation, geo-linkage, millennium cohort study, and mental health

<b>Project title</b>	llc_0028: Identifying clusters of COVID-19 and long COVID symptoms
<b>Institution</b>	University of Bristol

<b>Application type</b>	Data access
<b>Data access method</b>	UK Longitudinal Linkage Collaboration (UK LLC)
<b>Cohort</b>	NCDS, BCS70, Next Steps, and MCS
<b>Abstract</b>	<p>We are a team of researchers at the University of Bristol and University of Cambridge who would like to understand if symptoms of COVID-19 and long COVID group together. We want to answer questions like “does having COVID-19 with a cough make it more likely that you will lose your sense of smell?” We will do this by combining data from 9 cohorts into one large dataset. The dataset will have information about when a person had COVID-19 and what symptoms they had. It will also include age and sex. We will group people according to their symptoms and to find out if age, sex, or time since COVID infection makes a person more likely to have a group of symptoms.</p> <p>Other researchers have done a similar study in each of the 9 cohorts separately. They found two groups of symptoms. If some symptom groups are less common, by combining data across the 9 cohorts we are more likely to identify them. Knowing which symptoms group together may help doctors to diagnose long COVID and improve the quality of life of people that have it.</p>
<b>Keywords</b>	COVID clusters

<b>Project title</b>	llc_0027: Mental health and COVID-19 vaccine outcomes
<b>Institution</b>	University of Nottingham
<b>Application type</b>	Data access
<b>Data access method</b>	UK Longitudinal Linkage Collaboration (UK LLC)
<b>Cohort</b>	NCDS, BCS70, Next Steps, and MCS
<b>Abstract</b>	<p>COVID-19 vaccines play a major role in preventing people from getting severely ill or dying from COVID-19. Two factors affect how the vaccines can keep protecting people. First, people need to be fully vaccinated. Second, the vaccines need to be effective. This research aims to understand how well COVID-19 vaccines work in people with mental health conditions (e.g., depression and anxiety). Specifically, we try to understand two questions. First, In the UK population, what proportion of people with mental health conditions are fully vaccinated against COVID-19? Second, whether this group of people are more likely to get infected, get ill, or die due to COVID-19 even after being vaccinated, compared with those without mental health conditions? We will use data from the UK LLC to estimate how many people have taken COVID-19 vaccines and how effective the vaccines are, in people with and without mental health conditions.</p>

	This research will help inform healthcare providers on three aspects. First, how to engage and support people with mental health conditions to receive COVID-19 vaccines. Second, how to assist healthcare professionals to deliver vaccines to this group. Third, whether this group will need additional interventions to reduce health risks related to COVID-19.

<b>Project title</b>	Associations between early-life mental health indicators and sleep in adulthood
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data access method</b>	UCL Research Data Storage Service (RDSS)
<b>Cohort</b>	BCS70
<b>Abstract</b>	It is well known that not getting enough sleep can be harmful for your mental health. And we also know that when your mental health suffers, your sleep can suffer too. Poor sleep has also been linked to many different physical health problems and can shorten life expectancy. But can your mental health as a child continue to affect your sleep as an adult? In this project, we aim to use data from BCS70 to find out whether mental health in early life is related to sleep in adulthood. In the age 46 sweep, BCS70 participants were asked to wear a device on their thigh that tracked how much they moved for one week. We plan to use these data to estimate how much sleep participants were getting and compare this with the state of their mental health when they were much younger.
<b>Keywords</b>	Mental health, childhood, sleep, accelerometry, and risk factors

<b>Project title</b>	Enhancing the Millennium Cohort Study by linking environmental variables
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data linkage – GEO
<b>Data access method</b>	UCL Data Safe Haven (DSH)

<b>Cohort</b>	MCS
<b>Abstract</b>	This research project aims to study the environmental pollution exposure of Millennium Cohort Study (MCS) participants by linking annual pollution data to the residence and school location of MCS participants from 9 months until age 19 (waves 1 - 7). First, we will use the linked data to study inequalities of environmental exposure over the life course. Second, we will enhance the MCS data by creating research-ready linked data that other researchers could access.
<b>Keywords</b>	Air pollution, environmental inequality, life course, children, adolescents, and health

<b>Project title</b>	Air Pollution Impacts on Cognition for Children (APIC for Children) considering greenspace and noise impacts
<b>Institution</b>	London School of Hygiene & Tropical Medicine
<b>Application type</b>	Data linkage – GEO
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	MCS
<b>Abstract</b>	This research project will study how air pollution, greenspace, and noise around the school and home affect children's cognitive performance and development using the nationwide MCS and environmental data. MCS follows up over 19,000 lives born in 2000-01 across England, Scotland, Wales, and Northern Ireland. To date, cognitive performance was measured at age 3, 5, 7, 11, 14, and 17 years. Surrounding air pollution, greenspace, and noise will be measured from the pre-natal stage to the timing of each cognitive test. Despite increasing evidence, the impacts of such environment remains unclear. This study will provide further evidence from repeated measures of cognitive performance with wide range of air pollution, green space, and noise exposure over the nations for nearly two decades. This study could address a few novel research questions, including, 'Which pollutant, greenspace, and noise matters in terms of children's cognitive development?', 'When is critical to mitigate the impacts?', and 'Are those impacts different in urban and rural areas?'.
<b>Keywords</b>	Children, cognition, educational attainment, child development, environment, air pollution, greenspace, and noise

<b>Project title</b>	Association between self-reported mental health and property size
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data linkage
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	NCDS, BCS70, Next Steps, and MCS
<b>Abstract</b>	<p>The aim of this project is to exploit the rich Energy Performance Certificate (EPC) data available, in the first instance, for England and Wales (similar data are available for Scotland but have not yet been linked). The December 2021 release of EPC data contains UPRN codes, which facilitates matching to the reference dataset (Ordnance Survey AddressBase Premium Epoch 87 data (September 2021)).</p> <p>We propose to link the EPC data (which contains upwards of 100 variables) to participants of wave 3 of the COVID-19 web survey, since full addresses were available for this wave. The main variables we are interested in at this stage are the accurate measure of property size (m<sup>2</sup>), number of habitable rooms, property type, building age band, and tenure. It will also be possible to calculate the size of each participant's garden, and whether this is fully private, semi-public (e.g., open space around a block of flats), or absent.</p> <p>Further work could make use of the detailed set of variables relating to energy costs and energy efficiency, since this is likely to be the single most important public policy issue in the UK.</p>
<b>Keywords</b>	COVID-19, EPC, inequality, housing, and mental health

<b>Project title</b>	Effect of incentivisation on response and data quality in MCS
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data access method</b>	CLS shared drive
<b>Cohort</b>	MCS
<b>Abstract</b>	Retaining cohort members across time is a major aim of longitudinal studies, in order to reduce the possibility of non-response bias. The Millennium Cohort Study (MCS) is the largest on-going representative study of people born in the UK at the turn of this century. For the first time in MCS history, monetary incentives were introduced in the form of a randomised experiment in a web survey. Across the total issued sample (N = 13,533) - 75% were randomly allocated to the incentive group, and 25% were allocated to the control group. This study will assess the effect of the incentive on response rates and data quality (e.g., break off rates, item non-response, speeding, measures of satisficing, and completeness of responses).
<b>Keywords</b>	Attrition, data quality, incentives, non-response, and response rates

<b>Project title</b>	Machine learning screening for long-COVID (SAIL IGRP 1427)
<b>Institution</b>	Glasgow Caledonian University
<b>Application type</b>	Data access
<b>Data access method</b>	SAIL Databank
<b>Cohort</b>	MCS
<b>Abstract</b>	<p>This main aim of this project is to investigate the traits which contribute to the development of long-covid. These include traits at the person and community level.</p> <p>Statistical analyses will be applied to the Millennium Cohort Study to find out whether some traits are more common among people that develop long-covid. The project will first try to find patterns in the data, and then see if these patterns can predict the people who develop long-covid. Since the MCS follows people over time we will also be able to tell if a person's past living conditions have an impact on their current state of health.</p> <p>Finally, this research will be crucial to doctors and other healthcare experts since it will allow them to better treat and prevent long-covid. Thus, reducing suffering and healthcare costs.</p>

<b>Project title</b>	Understanding and mitigating associations between childhood neighbourhood deprivation and adolescent mental health in two UK birth cohorts
<b>Institution</b>	King's College London (KCL)
<b>Application type</b>	Data access
<b>Data access method</b>	UCL Data Safe Haven (DSH)

<b>Cohort</b>	MCS
<b>Abstract</b>	Neighbourhood deprivation refers to a lack of access to opportunities (e.g., education, employment) and resources (e.g., food, accommodation, clothing) among residents. Growing up in a deprived neighbourhood has been linked with a greater risk of mental health difficulties including emotional and behavioural problems in childhood and adolescence. However, some individuals fair better than expected despite living in less-than-ideal economic circumstances and are therefore described as being 'resilient'. We aim to investigate (1) whether childhood neighbourhood deprivation is associated with adolescent mental health and (2) what factors in an individual's life (e.g., cognitive skills, parenting, social support, green space access) help protect their mental health from the negative effects of neighbourhood deprivation during childhood. This knowledge will help improve targets for intervention to better support young people who grow up in deprived areas.

<b>Project title</b>	llc_0015: Socio-demographic determinants of COVID-19
<b>Institution</b>	University of Glasgow
<b>Application type</b>	Data access
<b>Data access method</b>	UK Longitudinal Linkage Collaboration (UK LLC)
<b>Cohort</b>	NCDS, BCS70, and MCS
<b>Abstract</b>	<p>Research has shown that some people are more at risk of COVID-19 than others because of personal factors, such as sex, ethnicity, or financial situation. In this study, we aim to understand whether differences in peoples' personal factors increase their risk of COVID-19. To do this, we will link data from 10 research studies with data on COVID-19 infection status from NHS health records. We will use statistical modelling to look at the relationship between personal factors and COVID-19. We will also look at whether certain combinations of personal factors increase someone's risk of COVID-19 further. For example, are Ethnic Minority women without a university degree more likely to report having had COVID-19 than others?</p> <p>Our findings will identify groups of individuals who had the highest risk of COVID-19 in the early waves of the pandemic. We will share the results with policy makers to help with decisions on how to support and protect these people.</p>
<b>Keywords</b>	COVID-19 and personal factors

<b>Project title</b>	llc_0010: Association of COVID19 and long COVID with disruption in employment and finances
<b>Institution</b>	University of Glasgow
<b>Application type</b>	Data access
<b>Data access method</b>	UK Longitudinal Linkage Collaboration (UK LLC)
<b>Cohort</b>	NCDS, BCS70, Next Steps, and MCS
<b>Abstract</b>	The COVID-19 pandemic has led to large-scale employment disruption, but little is known about the impact on employment for people who caught COVID-19. In this project, we will compare the differences in employment status, the number of hours worked, and financial circumstances for people who have had COVID-19 compared to those who have not had COVID-19. To do this we will use employment and financial data from research studies, in combination with NHS health records on COVID infection. Although we have information on COVID-infection from our research studies, NHS infection data will give us more reliable information about who was infected and when. NHS healthcare and hospital records will also tell us how severe peoples' infections have been, and how long they have

	lasted. We hope that this study will tell us how COVID19 infection might influence people's ability to carry on in work and cope financially. We will share the results of this project with policy makers to guide decisions on how to support people who have been infected by COVID19 to return to work and financially support their families. This will be particularly important given the large numbers of people who have long COVID.

<b>Project title</b>	MELD-B: Multidisciplinary ecosystem to study life course determinants and prevention of early-onset burdensome multimorbidity (SAIL IGRP 1377)
<b>Institution</b>	University of Southampton
<b>Application type</b>	Data access
<b>Data access method</b>	SAIL Databank
<b>Cohort</b>	MCS
<b>Abstract</b>	Many people live with several long-term health conditions like diabetes, heart disease or dementia. Multimorbidity means having more than one

	<p>health condition that may need medical management or behavioural adaptation. Throughout a person's life, many things influence their chance of multimorbidity, like biology (e.g., age), things that happen to them (e.g., infections), behaviours (e.g., smoking) and broader experiences (e.g., environment, education, work, income). Our aim is to use Artificial Intelligence (AI) methods to identify time points and risk factors across the life course that would help us prevent the development of early-onset, burdensome multiple long-term condition multimorbidity (MLTC-M). We will do this through multidisciplinary working and analysis of cohorts which provide data spanning many years in participants' lives. We will also use anonymised electronic health records to explore healthcare data. We will disseminate our findings to organisations and decision-makers to make this research impactful on a population level.</p>

<b>Project title</b>	Evaluating the student loans uptake and repayment among a cohort born in 1989
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	Next Steps
<b>Abstract</b>	<p>The recent government response to the Augur Review has been released and proposes a £11,500 reduction in student loans in real terms with the aim to reduce the amount of debt students graduate with. They have also proposed a new £25,000 repayment threshold, meaning graduates will make at least a modest contribution to paying back their student loan once they start benefitting from it. With the Next Steps data, we have an opportunity to better understand the nature of student loans repayment, including the large number of graduates who are not expected to come close to repaying their loans in full – and indeed a not insubstantial number are expected to make no repayments at all – yet we know very little about who these individuals are or what jobs they are doing. If they were disproportionately employed in 'socially valuable' occupations (such as social care, for example), would that change how non-repayment of loans was viewed, for example? This kind of analysis would shed new light on important policy questions, including what level of taxpayer subsidy of the student loan system is 'acceptable', and what implications different changes to loan repayment terms may have on repayments and for which groups. We are interested in understanding how SLC loan values and repayments vary in the Next Steps cohort by subject studied, university attended and income/occupation at age 25 as well as key demographic</p>

	characteristics (gender, ethnicity, parental education etc). Moreover, the planned work will have a strong methodological element, for example improving data quality by correcting any errors that we find in our data release, and allow us to conduct missing data reports and provide advice to users on how to handle missing data. By using the data ourselves for this research, this will also improve our knowledge and understanding of it, which will help improve the user support we are able to provide through training and user guides.

<b>Project title</b>	Is school absenteeism harmful to education and labour market outcomes? (SAIL IGRP 1351)
<b>Institution</b>	University of Strathclyde
<b>Application type</b>	Data access
<b>Data access method</b>	SAIL Databank
<b>Cohort</b>	MCS
<b>Abstract</b>	Consequences for educational attainment and labour market outcomes are not fully understood. Frequently absent students miss out on classroom learning and developing key dispositions crucial for future success. This project examines whether school absenteeism is

	<p>negatively associated with individuals' educational attainment and labour market outcomes. Additionally, it investigates whether psychosocial dispositions (e.g., self-esteem), behavioural dispositions (e.g., risky behaviour), and aspirations (e.g., educational) can explain the association between absenteeism and educational attainment. It will further consider the role of these dispositions and children's educational attainment in explaining the association between absenteeism and labour market outcomes. Finally, we will analyse whether the consequences of absenteeism for these outcomes differ across socio-demographic groups (gender, ethnicity, and socioeconomic background). Our study will provide much-needed evidence on the consequences of school absences for educational and labour market outcomes among different socio-demographic groups. This will give policymakers and practitioners the necessary information to place a greater emphasis on interventions to reduce absenteeism. The project will further clarify how absenteeism leads to disadvantages in these life course outcomes. By highlighting the relative importance of attending to learning loss and dispositions for educational and labour market success, it will become clear which interventions can mitigate the harmful effects of absenteeism. The study is timely within the current context of COVID-19 school closures - an enforced period of "absenteeism" for all children, with evidence of increasing absenteeism and socioeconomic disparities in absences after schools reopened.</p>

<b>Project title</b>	The role of greenspace in child development
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data linkage - GEO
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	MCS
<b>Abstract</b>	<p>The main aim is to explore in depth the role of area greenspace in children's cognitive, behavioural, and socioemotional development. The project will link in well with my ongoing research on this using the existing greenspace data in MCS (sweeps 1 to 6). The existing MCS data (only available at ward level for the UK) are out of date for most of the sweeps (they are based on MEDix, itself based on information in 2000). They are also indexing green cover only. This new project will provide more precise, granular, and up to date data for sweeps 1 to 7. Importantly it will include proximity to greenspace as well, which seems key for the child and adolescent population especially.</p>

<b>Institution</b>	University of Warwick
<b>Application type</b>	Data linkage - GEO
<b>Data access method</b>	UCL Data Safe Haven (DSH) / UK Data Service SecureLab
<b>Cohort</b>	MCS
<b>Abstract</b>	<p>This project aims to estimate the causal effect of the accessibility to food outlets that supply high-calorie food, such as fast food, on the weight of adolescents using longitudinal data. We will use the independent variation in the accessibility to fast-food outlets in the individual's living environment caused by COVID-19 lockdown restrictions, to identify the causal effect of the access to fast-food outlets on weight status.</p> <p>Our sample will be drawn from the three waves of the new COVID-19 survey of the Millennium Cohort Study (MCS) participants, covering the period between May 2020 and March 2021. This will be linked to the data from the MCS main survey merged with other administrative data, and of locations of food premises. The use of the linked rich individual-level longitudinal data makes the study unique, enabling us to estimate the above causal effect to inform policy.</p>

<b>Project title</b>	Childhood obesity, is fast food exposure a factor?
<b>Institution</b>	University of York
<b>Application type</b>	Data access
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	BCS70
<b>Abstract</b>	<p>Access to fast food has often been blamed for the rise in obesity which in turn has motivated policies to curb the spread of fast food. However, robust evidence in this area is scarce, particularly using data outside of the US. We investigate whether the access to fast food increased BMI of adolescents at a time when fast food restaurants started to open in the UK. We combine data on the location and timing of the first</p>

	openings of all fast-food outlets in the UK from 1968-1986, with data on objectively measured BMI from the 1970 British Cohort Study. The relationship between adolescent BMI and the distance from the respondents' homes and time since opening, is studied using regression analysis. We find that fast food exposure had no effect on BMI.

<b>Application type</b>	Data access
<b>Data access method</b>	UK Longitudinal Linkage Collaboration (UK LLC)
<b>Cohort</b>	NCDS, BCS70, Next Steps, and MCS
<b>Abstract</b>	This project will study the impacts of health care disruption in the UK. We will examine the experiences of those individuals affected by disruption, including whether it has impacted their health and if these impacts have had larger impacts on poorer people. We expect the project will be important for responding to the impacts of COVID-19 healthcare disruption and help benefit patients and service planners. We will share the findings with policy makers, NHS care managers, and politicians to help inform how the UK responds to COVID-19 healthcare disruption for years to come (e.g., which services to invest in or prioritise, which types of people need additional help) and also to improve NHS resilience for the future.

<b>Abstract</b>	Patients with long COVID have symptoms over a long time. Some patients do not receive a diagnosis by their doctors, and do not receive support for recovery from long COVID. With the requested data, we will compare two sources of information on long COVID, reported by patients and by their doctors. We will identify who are more likely to miss a diagnosis by doctors. The data on patients are needed to find who are at higher risk of having long COVID. The benefit to patients includes the improved diagnosis of long COVID. More patients will receive a diagnosis by doctors. They will have better chance to have healthcare support for recovery.

<b>Application type</b>	Data linkage
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	MCS
<b>Abstract</b>	Secondary schools in Scotland attended by MCS cohort members at sweep 7 will be classified according to their history during several waves of educational reform in the twentieth century: the creation of the selective system (1920s-40s), the transition to comprehensive schooling (1970s), and the reforms to mid-secondary curriculum and assessment (late 1980s). The resulting data, along with sweep 7 of the MCS, would then be used to extend a time series obtained from the Scottish School Leavers Surveys (biennially 1976-2002), and the Scottish Mental Survey (aged 16 in 1952). Previous research on this series (Box 1.7) has shown that the origins of schools and their rate of transition to new structures in the 1970s and 1980s had a persisting influence on young people's experience, but that policy gradually shaped schools of diverse origins into a common system. Adding MCS data would assess whether that common experience has lasted.

<b>Application type</b>	Data access
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	BCS70
<b>Abstract</b>	<p>By examining device-measured patterns of PA, and its association with PF in mid-life, there is the potential to identify windows-of-opportunity at this stage in the life course that could inform the future design and recommendation of interventions and guidelines. We intend to examine the raw accelerometer data in different ways than the derived outcomes provided in the main data set. We plan to derive new metrics from the raw data, focusing on how people accumulate their activity between- and within-days (activity pattern). The analysis will allow us to determine the different patterning of activity between high and low functioning adults in the BCS70. Results could then be used to develop more tailored public health messaging for promoting physical function in mid-life via physical activity.</p> <p>A limited number of derived variables from these data are available in the main survey data; however, access to the raw files allows for more further processing and analysis. For the purpose of this research project, the derived physical activity variables are required as 'exposures' in our association analysis, with physical function measures as the 'outcomes'.</p>

<b>Project title</b>	llc_0006: Comparing the burden of long COVID in the community as measured by self-report and electronic health records: a study by the CONVALESCENCE consortium
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data access method</b>	UK Longitudinal Linkage Collaboration (UK LLC)
<b>Cohort</b>	NCDS, BCS70, Next Steps, and MCS
<b>Abstract</b>	There is considerable uncertainty about the extent to which individuals with a history of COVID-19 go on to develop long COVID. In particular, separate findings from surveys of individuals in the community self-reporting long COVID and studies of primary care records have suggested that the proportion of individuals with a history of COVID-19 receiving a diagnosis of long COVID from general practitioners may be of an order of magnitude lower than the proportions of individuals reporting persistent symptoms themselves. In this study, we will compare the self-reporting of long COVID by individuals with their primary care records of long COVID, to further evaluate the extent of long COVID in the community being recognised by primary care practitioners.

<b>Application type</b>	Data access
<b>Data access method</b>	UK Longitudinal Linkage Collaboration (UK LLC)
<b>Cohort</b>	NCDS, BCS70, Next Steps, and MCS
<b>Abstract</b>	Antibodies are biological molecules that control immunity to viral infections. When individuals catch a virus such as COVID-19 or receive a vaccination to protect against COVID-19, they produce antibodies that travel around the body to tackle (or prepare to tackle) the infection. However, everyone's antibody response is different; some people produce fewer antibodies, or their antibodies might diminish more quickly over time. Examining levels of antibodies over time after COVID-19 infection or vaccination will help to identify groups of people who have a poor or decreasing antibody response, who might benefit from a booster vaccine. Examining antibody levels over time will also help to estimate the best time (i.e., how long after the second

	vaccination) to give a COVID-19 booster vaccine, in order to maximise immunity.

<b>Project title</b>	llc_0003: The social and mental wellbeing consequences of contracting COVID19
<b>Institution</b>	University of Glasgow
<b>Application type</b>	Data access
<b>Data access method</b>	UK Longitudinal Linkage Collaboration (UK LLC)
<b>Cohort</b>	NCDS, BCS70, Next Steps, and MCS
<b>Abstract</b>	<p>There are many mechanisms through which an individual's experience of COVID-19 may impact their ability to function healthily within society. COVID-19 symptoms may be associated with poorer mental wellbeing many months later, and more severe experiences of COVID-19 and the associated trauma could potentially have longer term consequences for mental wellbeing. Additionally, the experience of the disease itself and subsequent long-term symptoms may have a detrimental impact on employment and other social activities. Even experiencing asymptomatic COVID-19 potentially has problems: the requirement for those who test positive to socially isolate may disadvantage people in the labour market and have negative impacts on peoples' mental wellbeing. COVID-19 may also have longer term latent effects on people's wellbeing, even if people were initially asymptomatic. However, it is challenging to investigate these mechanisms using administrative or survey data alone. Self-reported measures of COVID-19 may not be accurate, while administrative health care data alone often does not contain subjective indicators of mental wellbeing or social indicators such as employment. Thus, in this project we aim to link survey data with health records provided by the UK LLC to address these topics.</p>

<b>Project title</b>	Growing up in coastal towns
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data linkage - GEO
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	NCDS, BCS70, Next Steps, and MCS
<b>Abstract</b>	Coastal towns have come to the fore in recent UK policy debates, as some of the most deprived neighbourhoods are now in coastal areas. These debates often raise concerns about the future of young people in these towns, largely because of the limited educational and employment opportunities. Despite this, there is almost no research on the impact of growing up in coastal towns. This led us to develop our research questions: 1. Are there place-based inequalities between coastal towns and the rest of the UK, and how do these inequalities impact on the young people who grow up in coastal towns? 2. How are youth aspirations shaped by their experiences of growing up in a coastal town? In light of these experiences, what are the solutions they would propose to improve their coastal communities? 3. What data can we use/generate to better understand these issues?

<b>Institution</b>	University of Manchester
<b>Application type</b>	Data access
<b>Data access method</b>	UK Longitudinal Linkage Collaboration (UK LLC)
<b>Cohort</b>	NCDS, BCS70, Next Steps, and MCS
<b>Abstract</b>	Infection and death rates linked to the SARS-COV-2 epidemic have been particularly high within the United Kingdom. One prominent source of increased risk throughout has been occupation, with several occupations identified as being high risk (e.g., health workers). Differences in occupation characteristics (e.g., ability to work from home, contact with the public, working outside) have been considered important in explaining increased risk of SARS-COV-2 infection and death. There is however still great uncertainty regarding the influence of occupation, and within occupational factors on infection, disease severity, and death.

<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data access method</b>	UK Longitudinal Linkage Collaboration (UK LLC)
<b>Cohort</b>	NCDS, BCS70, Next Steps, and MCS
<b>Abstract</b>	The predisposing factors responsible for individuals developing prolonged duration of COVID-19 symptoms over several months (long COVID) are unknown but exaggerated inflammatory and autoimmune responses have been proposed as key determinants. Individuals suffering from chronic inflammatory disorders, including atopic conditions and autoimmune diseases, have heightened risk of developing other inflammatory diseases, phenomena known as autoimmune and atopic diatheses. People with a history of atopic and/or autoimmune diseases might also have an increased liability for long COVID following SARS-CoV-2 infection if immune dysregulation is in part or wholly responsible for protracted symptomatology. However, associations between chronic inflammatory diseases and long COVID risk have not been studied rigorously in epidemiological settings to date.

<b>Project title</b>	Investigating environmental and individual characteristics interactions to understand inequalities in BMI and body composition
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data access method</b>	Direct release to applicant
<b>Cohort</b>	MCS
<b>Abstract</b>	Overweight and obesity has been increasing globally since the 1980s, widely attributed to an increasingly obesogenic environment. There have also been increases in inequalities in obesity, with high income countries largely show inverse associations between socioeconomic position (SEP) and body mass index (BMI). Although the environment has been credited with driving secular increases in obesity, not all individuals exposed to an obesogenic environment are overweight or obese. Psychological factors have also been highlighted in the development of obesity, and these factors may interact with the environment. It is hypothesised that less advantaged individual SEP results in worse psychological symptoms and greater exposure to an obesogenic environment, and that the environment moderates the mediating effect of psychological characteristics. Those with worse mental health have reduced coping ability when faced with obesogenic cues, and obesogenic environments result in greater opportunity to regulate negative emotions in maladaptive ways. Using structural equation modelling, these pathway and interactions can be tested in the Millennium Cohort Study, to further understand how inequalities in obesity arise.

<b>Project title</b>	InSPIRE: Innovating UK clean air policies to prevent cognitive disorders across the life course, particularly for vulnerable urban populations
<b>Institution</b>	University of Birmingham
<b>Application type</b>	Data linkage – GEO
<b>Data access method</b>	Project not pursued by applicant
<b>Cohort</b>	NCDS, BCS70, and MCS
<b>Abstract</b>	New emerging research shows that where people live determines the extent to which air pollution impacts cognitive health, particularly vulnerable populations living in major UK conurbations. Population density, transportation, and mortality rates from respiratory diseases are recognised to vary sharply according to environment and location.

	From a primary prevention standpoint, with particular reference to vulnerable populations in the UK's major conurbations, it is unclear which policies or strategies reduce the negative impact of social determinants and health inequalities on air quality and its effect on cognitive health. The InSPIRE consortium comprising 24 academics, 11 institutions, and +24 stakeholders seeks to co-develop pioneering primary prevention policies for improving air quality. We will engage in a highly ambitious research programme using the latest developments in complex system science modelling.

<b>Project title</b>	Examining relationships between the neighbourhood environment and health outcomes
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data linkage - GEO
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	MCS
<b>Abstract</b>	It is increasingly understood that one's environment impacts health and wellbeing and that individual behaviours are influenced by the context in which they occur. This project will aim to examine potential relationships between aspects of the neighbourhood environment, specifically green spaces and crime, and health outcomes including mental health and physical activity behaviours. The requested geographic identifiers will allow linkage between cohort member postcodes and: (1) distance to green spaces using Geographical Information Systems (GIS) in MCS ages 11, 14 and 17 and (2) crime data from Police.Data.UK in MCS ages 11, 14 and 17.

<b>Institution</b>	Royal Holloway, University of London
<b>Application type</b>	Data linkage – GEO
<b>Data access method</b>	Direct release to applicant
<b>Cohort</b>	BCS70
<b>Abstract</b>	<p>The purpose of this project is to investigate the lifetime outcomes of individuals that, during their adolescence, were residing in areas that were affected by the 1980s collapse of the coal mining sector in the UK. Using BCS70 data linked with geo-located information of coal mines in England and Wales, this project proposes to look into the trajectory of affected individuals, before and after the closures of the mines, relative to comparable individuals. The project will look in their performance, behaviour, and choices over their lifetime, along many dimensions, e.g., educational attainment that can be linked to subsequent labour market outcomes.</p>

<b>Project title</b>	Social mobility and educational attainment in the UK, and how it has changed over time
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	MCS
<b>Abstract</b>	The aim of the research is to generate a better understanding of and to provide evidence regarding educational attainment gaps in the UK, and the extent of social mobility in education over time. We aim to answer the following research questions:

	<ol style="list-style-type: none"> <li>1. What are the educational attainment gaps in England, specifically in relation to one's background including parental education and socioeconomic circumstances, gender, ethnicity?</li> <li>2. What are the mechanisms underlying these attainment gaps, and particularly what is the relationship between early life circumstances and parenting behaviours and educational attainment?</li> <li>3. How do educational attainment gaps compare across generations, and across countries in the UK?</li> <li>4. Does educational attainment relate to other aspects of life (e.g., mental health and wellbeing, labour market outcomes), and if so, to which ones?</li> </ol> <p>In providing updated estimates on the extent of social mobility in education for the UK – including the structural and behavioural mechanisms underlying it, how it has changed over time and how it varies across countries in the UK – this study will provide vital new evidence for policymakers to tackle problems that prevent poorer children from achieving their educational potential, and for reducing the attainment gap.</p>

<b>Project title</b>	Area-level variation in common mental disorders among lesbian, gay, bisexual and questioning compared to heterosexual young people: a feasibility study
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data access method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	Next Steps and MCS
<b>Abstract</b>	Lesbian, gay, bisexual, and questioning (LGBQ) young people are more likely than heterosexuals to have mental health problems and they are at higher risk of suicide. This is thought to be caused by stigma and discrimination. We think that stigma and discrimination towards sexual minorities might be worse in some areas of the UK than others. This could lead to geographical variation in mental health problems among LGBQ compared to heterosexual young people.

<b>Project title</b>	Investigating the pattern of physical activity accumulation in children with and without Asthma
<b>Institution</b>	Swansea University
<b>Application type</b>	Data access
<b>Data access method</b>	Direct release to applicant
<b>Cohort</b>	MCS
<b>Abstract</b>	It is well established that most children and adolescents aged between 5-18 years old in the UK fail to meet the current recommended guidelines of a minimum of 60 minutes per day of moderate-to-vigorous physical activity (MVPA; Chief Medical Officer, 2019). Current literature suggests that physical activity (PA) levels in children with Asthma are similar to those of their healthy counterparts (Jago et al. 2017),

	<p>although those with poorer disease control, greater severity of disease or a recent hospital admission tend to be less active (Pike et al. 2017). Further interpretation is confounded by possible interactions with age, sex, and maturation status, among other things, which have not previously been accounted for. Jago et al. (2019) proposes a stronger association between time spent sedentary and Asthma, than Asthma and PA, with the associations increasing with age and being greater in girls. A fundamental characteristic of PA and sedentary time is its compositional nature within a constrained time period (i.e., 24 hours). However, much of the existing data fails to account for this and, consequently, little is known regarding the pattern of PA and sedentary time accrual in those with Asthma compared to their healthy counterparts. Indeed, it is hypothesised that whilst total PA may not differ, the manner in which this PA is accumulated may vary considerably according to disease status and severity.</p>

<b>Project title</b>	Development of the British birth cohort studies as mixed methods resources for the study of mid- and later life
<b>Institution</b>	University College London (UCL)

<b>Application type</b>	Data enhancement
<b>Data access method</b>	Project not pursued by applicant
<b>Cohort</b>	NCDS and BCS70
<b>Abstract</b>	<p>The UK's birth cohort studies are recognised internationally as a unique resource. Following representative samples of Britons throughout their lives, these studies collect valuable data on an extensive range of quantitative variables and have made a tremendous contribution to the understanding of a broad range of issues, including ageing. However, the cohort studies contain relatively little qualitative data, which means that they are not able to provide robust evidence on individuals' own experiences of and perspectives on ageing. Our aim is to remedy that deficit by adding new qualitative data collection to the three oldest studies: the 1946 National Survey of Health and Development (NSHD), the 1958 National Child Development Study (NCDS), and the 1970 British Cohort Study (BCS70). Our project has both resource development and empirical aims. We will add a qualitative, person-centred approach to the 1946, 1958, and 1970 birth cohort studies in order to: (a) conduct longitudinal mixed methods research into ageing and well-being, (b) facilitate cross-cohort comparisons of cohort members' perspectives and experiences, and (c) enrich the cohort studies for other qualitative and mixed methods researchers. Our empirical investigations will focus on the means through which individuals construct identity and maximise well-being over the life course and in their daily lives.</p>

<b>Project title</b>	Academies' impact: Looking beyond exams
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data linkage
<b>Data release method</b>	UK Data Service SecureLab
<b>Cohort</b>	MCS
<b>Abstract</b>	Increased school autonomy and competition is being introduced internationally as a way to raise educational standards through quasi-market incentives. Academies have more autonomy and flexible governance, being out of Local Authority (LA) control. Previous literature has focused on pupil performance at KS2 and KS4 to evaluate the impact of attending an academy on school outcomes. This is in line with performance tables that largely drive school competition and parental choice. If academies are maximizing their position in performance tables, they may be targeting students at the threshold with traditional teaching focused on exams preparation or directing students to different subject choices according to ability. Looking

	beyond exam performance, I would like to answer the following research questions: (1) Are pupils at academies (sponsored/converters) doing better at problem solving and social skills than their peers at LA maintained schools? (2) What influence do schools (academies) have on subject choice pattern? In both cases the treatment group is "pupils attending academies" and the control group "pupils attending LA maintained schools that later became academies."

<b>Project title</b>	How does growth in earlier life modify the relationship between adult BMI and cardio-metabolic outcomes?
<b>Institution</b>	Loughborough University
<b>Application type</b>	Data access
<b>Data release method</b>	Direct release to applicant
<b>Cohort</b>	NCDS
<b>Abstract</b>	This project will provide novel insights into the contribution of body size trajectories to the resilience to adverse cardiometabolic outcomes observed in individuals of similar BMI. For example, this project will lead to a greater understanding of the specific age period(s) which confer cardiometabolic resilience and thus identification of groups of individuals (who share similar trajectories) in which this resilience manifests. This information is relevant to anyone conducting research on related topics, including life course epidemiologists, human population biologists and public health researchers. As BMI levels (and prevalence of overweight/obesity) are rising on a global scale, the beneficiaries of this grant extend beyond the UK alone. In addition to adding to the existing literature, the findings of the project will stimulate new research, for example, into the life course behaviours associated to cardio-metabolic resilience and any underlying body composition changes and hormonal/metabolic pathways.

<b>Institution</b>	University of Cambridge
<b>Application type</b>	Data linkage – GEO
<b>Data release method</b>	Project not pursued by applicant
<b>Cohort</b>	MCS
<b>Abstract</b>	School performance data show that pupils make markedly different levels of progress through secondary school and that the socio-economic gap in pupil achievement widens due to the different schools attended by different pupils. School assignment in England is determined by a system of school choice: since 1988, parents have had the right to nominate which schools they would like their child to attend. These nominations are combined with school admissions policies to determine the final allocation of pupils to schools. In this project we will study parents' preferences for school characteristics, and the implications of these and schools' admissions criteria for educational inequality.

<b>Project title</b>	Early life mental health, biomarkers in mid-life, and premature mortality: evidence from the 1958 British birth cohort
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data release method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	NCDS
<b>Abstract</b>	We capitalise on the availability of three assessments of mental health spanning childhood and adolescence in a population based prospective birth cohort to characterise trajectories of early life mental health and investigate their association with biomarkers in mid-life and all-cause mortality in early old age. We hypothesised that early life mental health is associated with biomarkers in mid-life and premature all - cause mortality. Considering that females live longer than males and that they are on average less healthy, we investigated modification of all hypothesised associations by sex. To further unpack the association between early life mental health and mortality, we grouped deaths in three broad categories, health related deaths, “deaths of despair (suicides, addiction related) and accidents.

<b>Project title</b>	Estimation of parent’s preferences over secondary schools in England
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data linkage – GEO
<b>Data release method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	MCS
<b>Abstract</b>	I would like to use data from the MCS and the NPD to identify the factors that guide parents’ choices of schools in England and Wales. I wish to explore two main questions: how parents trade-off different attributes of schools in their school applications (notably in terms of quality scoring, distance, and pupils mix); and the extent to which parents take account of the quality of schools in their choice of residential location. I would also consider how these preferences vary for different types of households.

<b>Project title</b>	'Primary' and 'secondary' effects of social origins on educational attainment: a new approach
<b>Institution</b>	Nuffield College
<b>Application type</b>	Data linkage
<b>Data release method</b>	UK Data Service SecureLab
<b>Cohort</b>	Next Steps
<b>Abstract</b>	<p>Despite decades of educational reform and expansion, social inequalities in educational attainment have been stubbornly persistent. Individuals from more advantaged backgrounds not only outperform those from less advantaged backgrounds in examinations (the 'primary effects' of social origins), but they also make more ambitious educational choices, even at comparable levels of prior performance (the 'secondary effects' of social origins). From a policy perspective, it is essential to understand the relative importance of primary and secondary effects in order to determine when and how to intervene to reduce them. This is an issue which both sociologists and economists have addressed, but existing findings are inconclusive. In addition, certain considerations have thus far been neglected. First, existing studies have focused almost exclusively on the influence of family economic resources, by and large ignoring other sources of (dis)advantage. This is likely to underestimate the size of both primary and secondary effects and can only tell a partial story about their sources and about over-time change. Second, little effort has been made to identify the mechanisms that generate these effects. We seek to address these neglected issues. Moreover, we will do so by examining the British case in comparative perspective. In this way we should be able to shed light on the possible influence of different educational institutions and policies.</p>

<b>Project title</b>	What Moderates the Scarring Effect of Youth Unemployment on Mental Wellbeing?
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data release method</b>	Direct release to applicant
<b>Cohort</b>	Next Steps
<b>Abstract</b>	<p>There is an established link between youth unemployment and later life mental health, both in the UK and in other developed countries. Less if known, though, about whether this is true of all individuals, or whether the association is confined to particular groups.</p> <p>Using Next Steps, we will study whether months unemployed between ages 16-20 is associated with GHQ scores at age 25 and whether this association differs by:</p> <ol style="list-style-type: none"> <li>1. Neighbourhood Index of Multiple Deprivation (age 14/15)</li> <li>2. Family Socio-Economic Status (age 13/14)</li> <li>3. Internal Locus of Control (age 14/15)</li> <li>4. Gender</li> </ol> <p>These questions will be investigated using OLS regression with interaction terms added between months unemployed and each of the factors listed in turn. To our knowledge Next Steps has not been used before to assess the impact of youth unemployment on later mental health.</p> <p>The requested data will be used to derive the months unemployment variable used in the regressions.</p>

<b>Project title</b>	Investigating the long-term outcomes of people who experience adversity in childhood, including time in care
<b>Institution</b>	University of Oxford
<b>Application type</b>	Data access
<b>Data release method</b>	Direct release to applicant
<b>Cohort</b>	NCDS and BCS70
<b>Abstract</b>	<p>People who spend time in the care of children's services have poor health, education, and employment outcomes across the life course. These studies suggest that it is the experience of being in care which leads to poor outcomes. The present study proposes to use quasi-experimental methods to explore the contribution of the care experience to later life outcomes for participants in two birth cohorts (1958 and 1970). I work in collaboration with two historians at the University of Oxford who will conduct qualitative analyses (of other sources) to complement our interpretation of the findings. The study will contribute to a greater understanding of the ways in which welfare provision impacts on long-term outcomes of its recipients.</p>

<b>Project title</b>	Faith Schooling, Faith and Economic and Educational Outcomes
<b>Institution</b>	Lancaster University
<b>Application type</b>	Data linkage – GEO
<b>Data release method</b>	UK Data Service SecureLab
<b>Cohort</b>	Next Steps
<b>Abstract</b>	The project seeks to examine the importance of faith, and of attending a faith school on educational and other economic outcomes (such as earnings at age 25, and measures of non-cognitive skills like risk aversion, also at age 25). There will also be inference on the importance of the ethos of a faith school by comparing, among those attending a faith school, those who are faithful (i.e., report a high level

	of how important their faith is in their everyday life) with those who are not faithful to see if the faithful perform better in faith schools. The requested geographical data provides the distances to the schools that could have been attended by the next steps cohort member. This is important as it provides some information on the other options available to the cohort member when they made their school choice.

<b>Project title</b>	School level influences on the early secondary phase
<b>Institution</b>	Manchester Metropolitan University
<b>Application type</b>	Data linkage
<b>Data release method</b>	UK Data Service SecureLab
<b>Cohort</b>	MCS
<b>Abstract</b>	The project will analyse how the experiences and outcomes of socio-economically disadvantaged pupils compared to their peers between the end of primary school and age 14 and identify how this varies with pupil, school, and place characteristics. A UKDS SecureLab application (128602) has been made to access the KS2 linked MCS data to test pupil and place effects; this request seeks to add to this usage through the analysis of the effect of school level variables. The main research question is: Are age 14 outcomes influenced by school characteristics?

	The school characteristics to be considered include peer characteristics, measures of school quality and the size of the school. The change in these characteristics from primary to secondary will also be tested.

<b>Institution</b>	University College London (UCL)

<b>Application type</b>	Data access
<b>Data release method</b>	Direct release to applicant
<b>Cohort</b>	NCDS
<b>Abstract</b>	<p>Parental investments in children can take one of three broad forms:</p> <ol style="list-style-type: none"> <li>1. Time investments during childhood and adolescence that aid child development, and in particular cognitive ability.</li> <li>2. Educational investments that improve school quality and hence educational outcomes.</li> <li>3. Case investments in the form of inter vivos transfers and bequests.</li> </ol> <p>We develop a dynastic model of household decision making with intergenerational altruism that nests a child production function, incorporates all three of these types of investments, and allows us to quantify their relative importance and estimate the strength of intergenerational altruism. Using British cohort data that follows individuals from birth to retirement we find that around 40% of differences in average lifetime income by paternal education are explained by ability at age 7, around 40% by subsequent divergence in ability and different educational outcomes, and around 20% by inter vivos transfers and bequests received so far.</p>

<b>Application type</b>	Data access
<b>Data release method</b>	Direct release to applicant
<b>Cohort</b>	MCS
<b>Abstract</b>	<p>This research project examines household moves involving children in the UK during their first 14 years (over 2001-2016). We assess the prevalence and nature of moves in relation to children’s age and previous moving history, asking three research questions. First, did the probability of moving vary with children’s age? Second, did life events differentially affect the probability of moving as children grew older? Third, did the characteristics of moves change as children grew older? We use data from all 6 waves of the Millennium Cohort Study, including all families who participated in at least two waves (n=17,300). The main analysis uses multilevel event history analysis, which treats moves as recurrent events to allow repeat mobility throughout the study period. We consider as relevant life events partnership changes, changes in number of children in the household, and change in employment at household level. To characterise moves, we rely on information about house quality, housing tenure, and (if available) distance moved.</p>

<b>Abstract</b>	<p>The policy discussion about ‘widening participation’ (WP) in UK higher education (HE) has expanded beyond traditional socioeconomic gaps to identifying ‘first in the family to attend university’ students as a specific form of disadvantage. ‘First in Family’ (FiF) refers to students who attend university (and obtain a degree), but whose mother and father did not. Fifteen of the 24 Russell Group universities target these</p>

	<p>potential students in their WP campaigns, although little is known about their characteristics. This project will be the first large-scale research study on FiF in the UK and will inform national and university level WP policies.</p> <p>This research will shed light on FiF students and how well this proxies existing measures of disadvantage. We will compare FiF students to their peers who could have been FiF, but who do not go to HE, and those who are not FiF to attend university, to identify whether there are substantive differences in their non-cognitive traits such as aspirations, locus of control (perceived autonomy over their life) and academic self-concept to identify whether these explain their higher educational trajectories. We will then explore the decisions FiF students make in terms of the HE institution, subject choice and drop-out as compared to their non-FiF peers at university. Furthermore, we will investigate how being FiF affects labour market outcomes. We will examine a contemporaneous generation of young adults and compare them with two younger cohorts, using nationally representative data to determine how WP is affecting HE aspirations over time.</p>

<b>Project title</b>	Undermatch in higher education: prevalence, drivers, and outcomes
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data release method</b>	UCL IOE server
<b>Cohort</b>	Next Steps
<b>Abstract</b>	<p>It is widely known that there are substantial socio-economic gaps in students' likelihood of attending higher education (HE). But students from disadvantaged backgrounds are also less likely to attend a high-status university than their richer counterparts, even when they have similar A-level grades (Chowdry et al, 2013). This has important implications for disadvantaged students' future earnings and employment prospects, and hence for equity and social mobility. This project would produce the first UK-based research on this so-called phenomenon of 'undermatch' – where a student's academic credentials would permit them to access a university that is more selective than the one they attend. While the evidence suggests that this is a significant issue in the US, with over 40% of students undermatching in their postsecondary choice (Smith et al 2013), we have little idea of the scale of the issue in the UK.</p> <p>In this project we will use linked the longitudinal study Next Steps to analyse the phenomenon of undermatch in the UK, and its implications</p>

	<p>for students' employment prospects. In particular, we will address the following research questions:</p> <ol style="list-style-type: none"> <li>1. What is the extent of undermatch in the UK system?</li> <li>2. What are the characteristics of undermatched students (such as gender, ethnicity, age, socio-economic status, prior attainment, predicted grades, subject choice at A-level, school type)?</li> <li>3. Do students who undermatch have worse outcomes at university (drop out, and less likely to achieve a good degree)?</li> <li>4. Do undermatched students have worse early labour market outcomes (be unemployed, in lower status jobs or earn less after graduating)?</li> </ol>

<b>Project title</b>	The effects of student loan debt on graduates' financial and life decisions in the UK
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data release method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	Next Steps
<b>Abstract</b>	<p>The increasing use of student loans to fund higher education is a global phenomenon and a factor fuelling its expansion and rising participation. In England, loans have facilitated the raising of tuition fees allowing increased access while limiting public expenditure. The vast majority of undergraduates depend on these loans to fund their studies and compared with previous decades, more students rely on them and borrow larger amounts to pay for their higher education. One of the consequences of funding access through such policies is increasing student loan debt. As levels of student loan debt have risen over time, so has the time it takes graduates to repay their loans. Current estimates suggest that the majority of graduates in England will be paying off their loans for most of their working lives and a sizable proportion will never pay off their loans in full. In other words, student loan debt is not a brief interlude, but a "new normal" that may shape graduates' post-university choices, behaviour, and life events well into the future. Yet, we know nothing about the longer-term consequences of growing student loan indebtedness on graduates' life choices in England. US research is available but might not be applicable to graduates in England because of differences in the student loans systems in the two countries.</p>

<b>Project title</b>	The long-run effects of attending a preferred secondary school: Evidence from an English cohort
<b>Institution</b>	Lancaster University
<b>Application type</b>	Data access
<b>Data release method</b>	UK Data Service SecureLab
<b>Cohort</b>	Next Steps
<b>Abstract</b>	Schools vary in quality, and in England, high-performing schools tend to be over-subscribed: there are more applicants than places available. In this paper, we use nationally representative cohort data linked to administrative education records to study the long-term consequences of failing to gain admission to one's preferred secondary school in England. Our empirical strategy leverages features of the institutional setting and the literature on school choice to make a credible case for a selection-on-observed variable identifying assumption. Failing to gain a place at a preferred school had little impact on performance in high-stakes examinations, but increased drop-out rates from high-school and university and reduced mental health and income at age 25 years. A potential channel is increased early engagement in risky behaviours such as drug use and truancy. These effects are especially pronounced in areas which deployed a manipulable assignment mechanism for school places. Our results show that schools are important in shaping more than test scores, and the workings of the school admission system play a fundamental role in ensuring access to good schools.

<b>Abstract</b>	Interviewers on MCS are required to follow extensive and complex contact and tracking protocols to minimise non-contact and non-location and there is potential for mistakes or failure to follow protocols correctly. At wave 5 this information was recorded in the field using paper contact sheets which interviewers transcribed into an electronic system at home. At wave 6, interviewers were equipped with tablets, and the ECS system was developed for recording contact and tracking attempts. Extensive training was provided to interviewers on the new system. The objectives were to improve the quality and timeliness of paradata for fieldwork monitoring and mover tracing and to maximise interviewer compliance (and hence survey response) with the fieldwork protocols. This paper looks at the impact of the ECS on survey protocol compliance, non-contact and non-location rates, and survey cost.

<b>Project title</b>	The effects of socio-economic circumstances on physical activity patterns among young people

<b>Institution</b>	Swansea University
<b>Application type</b>	Data access
<b>Data release method</b>	Direct release to applicant
<b>Cohort</b>	MCS
<b>Abstract</b>	UK public health guidelines state that children should undertake 60 minutes per day of moderate-to-vigorous intensity physical activity (MVPA) and that achieving this is associated with better health (Department of Health, 2011). However, our work in the Millennium Cohort Study (MCS) observed that MVPA levels are low – with only half of primary school-aged children partaking in enough activity (Griffiths et al 2013). Less is known about UK-wide activity levels of adolescents but use of accelerometers at the sixth survey of MCS allow activity levels and patterns in this sample to be determined. Our study seeks to examine these data and to explore if time spent being physically active and sedentary varies by socio-economic circumstance (SEC).

<b>Project title</b>	Child abuse and Metabolic Syndrome: A Life-course Approach
<b>Institution</b>	University of Bedfordshire
<b>Application type</b>	Data access
<b>Data release method</b>	Direct release to applicant
<b>Cohort</b>	NCDS
<b>Abstract</b>	Metabolic syndrome (MetS) is an important public health issue. Metabolic syndrome which is clustering of metabolic abnormalities such as abdominal obesity, low HDL, and hypertriglyceridemia increases cardiovascular risk. Increasing evidence suggest adverse childhood experiences might accelerate metabolic syndrome in midlife and at older ages. Emerging evidence suggest that the association between child abuse and MetS may include indirect pathways. There is also evidence linking social support with metabolic syndrome and social support with child abuse. However, research on the role of social support in the lives of abused and neglected children and the extent to which this hypothesised lack of social support (as a mediator) lead to increased risk of MetS in midlife is unknown. This study expands on Delpierre et al.'s (2016) study by testing the association of physical, sexual, emotional/psychological abuse and neglect on risk of MetS, drawing upon the same 1958 British Birth cohort and the role of social support in influencing this association. Therefore, an existing on-going long-term survey of approximately 17,000 UK babies born during one

	<p>week in 1958 will be used. The relative importance of pathways (social support) linking physical, sexual, emotional/psychological abuse and neglect with MetS can only be assessed if these pathways are modelled simultaneously. Path analysis which is a type of Structural equation modelling (statistical method) that will allow for such simultaneous modelling will be used. Thus, this research is of clinical importance, as it has implications for the identification of causal mechanisms in onset of MetS following child abuse. It is hoped that greater understanding of causal mechanisms may lead to the identification of high-risk groups, novel therapeutic targets to prevent onset of MetS and to inform guidelines for the effective management of children abused and neglected.</p>

<b>Data release method</b>	UCL IOE server
<b>Cohort</b>	MCS
<b>Abstract</b>	<p>Exercise and diet quality in childhood are positively associated with health outcomes, both physical and mental. However, it's not clear whether this association reflects a causal relationship or is simply due to unobserved characteristics of children and/or their families. Furthermore, little research is available on potential complementarities between exercise and diet quality – i.e., whether one can substitute for the other, or whether they are both necessary for health and development. In this work, we plan to use the MCS wave 6 data to derive measures of diet quality and exercise, using weather data to instrument for these behaviours.</p>

<b>Project title</b>	Early life mental health, biomedical risk factors in mid-life, and premature mortality: the 1958 British birth cohort
<b>Institution</b>	University College London (UCL)

<b>Application type</b>	Data access
<b>Data release method</b>	UCL IOE server
<b>Cohort</b>	NCDS
<b>Abstract</b>	<p>Early life mental health is known to be associated with socio-economic outcomes and mental health in adulthood. We investigated the association between conduct problems and affective symptoms in childhood and adolescence with biomedical risk factors in mid-life and premature all-cause mortality. Methods: We used the 1958 British birth cohort which includes prospective data on early life mental health (age 7 to 16), a biomedical survey at age 44/45 (n = 9210) and information on all – cause mortality up to age 55 (n = 17657). Adjustment for potential-confounders-person and variable-centred approaches allowed us to test the accumulation of risk and sensitive period hypotheses, as well as investigate the differential predictive ability of conduct problems and affective symptoms. Results: In both person and variable centred approaches, early life mental health was associated with biomedical risk factors, where associations were more pronounced in women, as well as all-cause mortality. The accumulation of risk and sensitive period hypotheses were supported in associations with biomedical risk factors and all – cause mortality. Affective symptoms in adolescence and conduct problems in childhood were the stronger predictors of biomedical risk factors and mortality risk. Conclusion: Experiencing affective symptoms and conduct problems in early life is associated with less favourable levels of risk factors and mortality in mid-life. The transition from childhood to adolescence appeared to be a sensitive period in both genders, but the broader differences in the association with biomedical risk factors point to potentially gender specific mechanisms of action, as well as early life mental health being partly one of the drivers of the gender paradox in health and mortality.</p>

<b>Project title</b>	A novel 24-hour compositional data analysis approach to understand the influence of sleep, sedentary time, and physical activity on children's and adolescents' behavioural, psychological, and cognitive health
<b>Institution</b>	University of East Anglia
<b>Application type</b>	Data access
<b>Data release method</b>	Project not pursued by applicant
<b>Cohort</b>	MCS
<b>Abstract</b>	Children's healthy development and wellbeing are influenced by their movement behaviours (i.e., sleep, sedentary behaviour, physical activity). These behaviours have traditionally been studied in isolation, but the emerging field of time-use epidemiology has signalled a paradigm shift, where such behaviours are considered as inter-related and occurring in a mutually exclusive manner over a finite period of time, such as a 24-hour day. The proposed study will examine associations between 24-hour movement composition (assessed by wrist worn accelerometry) and markers of behavioural, developmental, psychological, and cognitive health.

<b>Data release method</b>	UCL Data Safe Haven (DSH)
<b>Cohort</b>	MCS
<b>Abstract</b>	<p>Data collection in cohort studies is typically conducted over several months, and the circumstances across time and/or place vary during the fieldwork period. Such differences in the circumstances create quasi-experimental conditions, which allow for inference between these structural conditions at the given time and in the given place, and the individual cohort members' lives. These structural conditions may include policy interventions (e.g., changes to school funding, or health care reforms), local economic shocks (e.g., firm closures), and environmental incidents (e.g., localised flooding and extreme weather), which in turn may affect the cohort members' wellbeing, physical and mental health, attitudes, or economic decisions. Furthermore, where significant relationships are found, this understanding has a potential to unlock the value of the longitudinal observational data to make robustly causal claims. The research aims to answer the following questions: What are the relationships between the structural conditions during the MCS fieldwork and the cohort members' responses to questions? How do these relationships affect further outcomes across cohort members lives? The exact date of interview of the MCS1 will be used to identify whether the interview took place before or after the terrorist attacks which took place on the 11 September 2001, and the dates of the MCS6 will be linked to the Policy and Events Headlines Bank, which collected BBC news articles across the four UK nations during the period of the age 14 fieldwork. This linked dataset will be used for preliminary and exploratory analysis of the impact of these events on the cohort members' responses to various questions.</p>

<b>Project title</b>	Early-life cognitive function, sex, socioeconomic status, and the development of obesity in the UK and USA
<b>Institution</b>	University of Edinburgh
<b>Application type</b>	Data access
<b>Data release method</b>	Direct release to applicant
<b>Cohort</b>	NCDS
<b>Abstract</b>	<p>Pre-morbid cognitive functions are associated with many later life health outcomes, above and beyond what can be explained by socioeconomic variables from both early and later life. More recently,</p>

	sex has been found to interact with pre-morbid cognitive function, such that women with higher cognitive function tend to be healthier than their male counterparts. This project aims to model weight gain and loss, as assessed by BMI, across three decades of life in two large, comparable samples, the National Child Development Study (NCDS) from the UK and the National Longitudinal Study of Youth (NLSY) from the US, both of which include a rich set of early life social and cognitive variables. While incorporating these early and later life socioeconomic variables, we wish to investigate the associations among cognitive function, sex, nationality, and BMI from early adulthood into midlife.

<b>Application type</b>	Data access

<b>Data release method</b>	UCL IOE server
<b>Cohort</b>	MCS
<b>Abstract</b>	In this project we aim to examine empirically the causal nature of the relationship between mode of delivery and maternal mental wellbeing, mother-child attachment, and children's non-cognitive outcomes. The main research question is whether caesarean sections have a causal impact on maternal mental health, which could in turn affect the child's emotional development. In order to provide credible causal evidence about the effects of caesarean sections on these outcomes, we will exploit time variation in the unplanned c-section rate, which has been associated with physician leisure incentives. We plan to follow the methodology of Costa-Ramón, Rodríguez-González, Serra-Burriel, and Campillo-Artero (2018), where the time of birth is used as an instrumental variable for whether a c-section was performed. This will allow us to overcome potential omitted variable bias and to focus on caesarean sections that do not respond to a clear medical indication. In order to implement this strategy, we need to control for the weekday of admission to the hospital and the weekday of birth, given that these variables could affect the probability of caesarean sections themselves (c-sections are more common during workdays than during weekends – see e.g. Brown (1996)), as well as the quantity and quality of resources available at the hospital or maternity ward, which could have an independent impact on the mother's satisfaction with childbirth.

<b>Cohort</b>	NCDS and BCS70
<b>Abstract</b>	SESC explores the history of education in Britain after 1945, with a focus on how this was experienced by parents and pupils. We are particularly interested in how educational experience informs identity at different points across the lifecycle (rather than just when at school) and how this varies between generations. Our core research question is: how does educational experience affect the whole life cycle of individuals, from their parents' schooling to their own schooling, through to decisions about their own children's schooling?

<b>Project title</b>	The relationship between child maltreatment and trajectories of antisocial behaviour across the life-course
<b>Institution</b>	University of Oxford
<b>Application type</b>	Data access
<b>Data access method</b>	Direct release to applicant
<b>Cohort</b>	NCDS
<b>Abstract</b>	<p><b>Aims:</b> The proposed research aims to investigate the relationship between child maltreatment and trajectories of antisocial behaviour (ASB) across the life-course. Our main research question will be: does child maltreatment increase the life-time risk of developing chronic ASB?</p> <p><b>Background:</b> There is a well-documented relationship between child maltreatment and antisocial behaviour. However, it is less clear whether child maltreatment increases the life-time risk of chronic ASB or whether its negative effects are confined to specific developmental period(s) (e.g., adolescence). I have recently carried out a systematic review and meta-analysis of the longitudinal evidence examining the relationship between child maltreatment and antisocial behaviour across the life-course and found a paucity of evidence on life-course trajectories of ASB and their relationship with child maltreatment. In order to address this limitation, I will use novel latent growth curve analysis techniques for handling ordinal data to analyse rich longitudinal data available from the 1958 British birth cohort.</p>

<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data access
<b>Data access method</b>	Direct release to applicant
<b>Cohort</b>	MCS
<b>Abstract</b>	Previous studies using administrative data found a significant short run increase in pupil intake quality for earlier academies and post-2010 sponsored academies. Additionally, there is evidence of increasing social stratification in secondary schools that became academies after 2010. The rich MCS data containing detailed information on family income and individual ability allow to assess in a more precise way secondary school composition and segregation of academies compared to only using free school meals and Key Stage 2 performance available on administrative data. The research issue is the composition of schools that become academies and whether this varies across different types of academies. I investigate if there is

	stratification with pupils from different backgrounds segregated in different school types. The outcome of interest is the distribution of pupils' characteristics across secondary schools.

<b>Abstract</b>	My project seeks to estimate the distribution of pecuniary returns to post-secondary schooling in UK, using a marginal treatment effect (MTE) approach. This approach aims to identify a differential in monetary returns, known as a treatment effect, for those individuals at the margin of selecting some level of education beyond secondary schooling. This MTE technique requires instrumental variables, for the estimator to be well identified. One example, extensively used in the literature, is distance to university during childhood. Children who live nearby universities may be more likely to go on to enter university, holding constant the expected pecuniary returns to university.

<b>Abstract</b>	Private school choice continues to be significantly dependent on both price and “quality” of competition from local state schools (Blundell et al., 2010). There is little evidence as to the importance of grammar schools as competition, although it is widely assumed that, when available, these may substitute for private schooling for those who can pass the ‘11-plus’ test. We seek to estimate the determinants of choosing private schooling, including the importance of geographical accessibility to both private schools and “high quality” state schools, including grammar schools. Our hypothesis is that the accessibility of private schools will be positively associated with demand for private schooling, while the accessibility of “high quality” state-funded alternatives will be negatively associated with demand for private schooling.

<b>Project title</b>	The effect of school composition on young people's educational attainment in England, in comparison to the family and neighbourhood
<b>Institution</b>	University of Edinburgh
<b>Application type</b>	Data linkage
<b>Data release method</b>	UK Data Service SecureLab
<b>Cohort</b>	MCS
<b>Abstract</b>	This PhD's main aim is to understand how the inequalities found between families and neighbourhoods effect young people's educational attainment. Inequalities have been conceptualised through young people's access to economic, social, and cultural capital at home and within the area. Both the analysis undertaken so far, and literature on neighbourhood effects highlights the link between schools and both place and attainment. Therefore, analysis containing both levels could elucidate the link between the neighbourhood you live and the composition of the school you attend.

<b>Institution</b>	University of Nottingham
<b>Application type</b>	Data linkage
<b>Data release method</b>	Direct release to applicant
<b>Cohort</b>	MCS
<b>Abstract</b>	In my research study, I will seek to analyse the mechanism that results in fewer students from deprived socio-economic backgrounds attending grammar schools. In order to do this, I will run a regression on the likelihood of applying to grammar school, depending on a measure of socio-economic class, controlling for other individual and school level characteristics. I will then run a regression on the likelihood of a child attending a grammar school for different socio-economic backgrounds, conditional on applying. Thus, endeavouring to differentiate between the effects resulting in fewer children from deprived socio-economic backgrounds entering grammar school. To my knowledge previous research studies haven't differentiated between the effects resulting in

	fewer children from deprived socio-economic backgrounds entering grammar schools. However, my research study should give an insight into this relationship and distinguish whether it is a result of fewer children applying or whether they aren't getting in conditional on applying, (or a combination of these effects).

<b>Application type</b>	Data linkage
<b>Data release method</b>	SAIL Databank
<b>Cohort</b>	MCS
<b>Abstract</b>	The aim of this project is [...] to address important issues relevant to children's health. This will be done by enhancing information collected in the longitudinal, UK-wide Millennium Cohort Study (MCS) by linking participating children to their routine health records. These issues include: health service implications of early life onset of obesity and overweight; timeliness of immunisations; association of infections with asthma and allergic disorders in childhood; and burden of disease due to childhood injuries.

<b>Project title</b>	Investigating the effect of air pollution on cognitive outcomes in MCS
<b>Institution</b>	London School of Health and Tropical Medicine
<b>Application type</b>	Data linkage – GEO
<b>Data release method</b>	
<b>Cohort</b>	MCS
<b>Abstract</b>	This project examines the impact of 6 pollutants (CO, NO2, NOX, PM10, PM25, SO2) on cognitive outcomes of MCS cohort members. Data at postcode level has been linked to the nearest DEFRA 1km grid point for these pollutants, spanning the period 1999 - 2015. Both 'time-sliced' (i.e., a single measure of each pollutant based on year of interview) and 'accumulated' (i.e., total exposure based on length of time lived at each reported address) have been calculated.

<b>Project title</b>	The long-term consequences of infant domestic adoption (Nuffield Foundation)
<b>Institution</b>	King's College London (KCL)
<b>Application type</b>	Data access
<b>Data release method</b>	
<b>Cohort</b>	BCS70
<b>Abstract</b>	The life-long nature of adoption is enshrined in UK law, but systematic evidence on outcomes of infant adoption beyond the early adult years is severely limited. This study is designed to fill that gap by exploring the long-term consequences of UK infant domestic adoption using data from the 1958 and 1970 British birth cohorts. We will compare adopted people with their age-peers on indicators of mid-life socio-economic circumstances; intimate relationships and social support; health-related behaviours, physical health, and cognition; mental health and well-being, and alcohol problems and crime.

<b>Project title</b>	The early life social and psychosocial origins of adult cancers
<b>Institution</b>	French National Institute for Health and Medical Research (INSERM) (France)
<b>Application type</b>	Data linkage
<b>Data release method</b>	
<b>Cohort</b>	NCDS
<b>Abstract</b>	The research question I would like to answer would focus the "exposure" stage for cancer incidence in the first 16 years of life. Here, the longitudinal design from birth is key, since prospective and therefore unbiased data are available on the childhood context, including detailed social and psychosocial factors. The age of the cohort members is also key – they are now entering a life stage where cancer incidence will increase exponentially – and especially among men. Given the improvements in the UK regarding cardiovascular disease and mortality, the big public health issue for this generation will be morbidity and mortality from cancers and neurodegenerative

	diseases. This data linkage will provide important data to explore these big public health questions.

<b>Project title</b>	Data linkage of the 1958 National Child Development Study dataset with the UK AAA screening programmes
<b>Institution</b>	University of Leicester
<b>Application type</b>	Data linkage
<b>Data release method</b>	
<b>Cohort</b>	NCDS
<b>Abstract</b>	<p>Infra-renal aortic diameter is an independent risk factor for cardiovascular morbidity and mortality. The health services across the UK have introduced ultrasound screening for abdominal aortic aneurysm for men in the year of their 65th birthday and around 400,000 men are invited for screening every year. Currently AAA screening programmes are solely focussed on the diagnosis and treatment of AAA (approximately 1.5% prevalence in those screened). Men without AAA have their aortic diameter recorded but nothing is done with this information. Research is ongoing to determine the prognostic significance and potential clinical use of infra-renal aortic diameter at age 65. Little is known about the causes of abnormal aortic diameter other than traditional cardiovascular risk factors, however. The effects of in-utero development, environmental and socio-economic factors prior to the age of 65 are unknown. There is some evidence that nutrition in utero may influence cardiovascular disease and aortic development but direct associations with aortic diameter in later life have not been described. In 2023 the men in the 1958 National Child Development Study will be invited for AAA screening. Women are currently not screened for AAA, but it is feasible by 2023 that targeted screening of high-risk women for AAA may be introduced. In this enhancement we are proposing to link data from the 1958 National Child Development Study with the UK AAA Screening Programmes.</p>

<b>Project title</b>	Early access to a subset of transcribed age 11 NCDS essays, to be combined with NCDS survey variables
<b>Institution</b>	London School of Economics and Political Science (LSE), University of London
<b>Application type</b>	Data access
<b>Data release method</b>	
<b>Cohort</b>	NCDS
<b>Abstract</b>	The principal research question of this project is: does attending a private school influence subjective expectations about the future? To address this question our analysis has three stages. First, we will use a matching procedure to identify a set of respondents who have the same socio-economic background but who differ in terms of the type of school they attended. Then we will use this matched sample to conduct some simple bivariate regression analyses to observe whether there are differences in the types of occupations these students expect they will be employed within when they are 25. Finally, we hope to qualitatively analyse the essays of the students. This is the main part of the project, and the matching is primarily being used as a method of case selection to identify respondents whose essays may best help us address our research question.

<b>Project title</b>	Data linkage NCDS-BCS for neighbourhood effects research, health, and well-being
<b>Institution</b>	University College London (UCL)
<b>Application type</b>	Data linkage
<b>Data release method</b>	UK Data Service SecureLab
<b>Cohort</b>	NCDS and BCS70
<b>Abstract</b>	<p>To link data to the National Child Development Study (NCDS) and British Cohort Study (BCS) to conduct research for a Leverhulme Project Grant due to start in June 2016 and last for two years. The project will contribute to neighbourhood effects research through a novel life course perspective. It will determine whether living in a deprived neighbourhood in early life matters more for later life health and wellbeing than other life stages. The data from the two British birth cohort studies will provide a unique perspective of individuals currently in mid to later life who have been interviewed throughout the latter 20th Century and early 21st Century during which time small area data from the census can be linked. Our data are a set of 2011 Census Lower Super Output Area and Data Zone polygons that can be matched to the postcode centroid of each individual in the cohort studies at each sweep from age 16 (i.e., 1974 in NCDS and 1986 in BCS). The data include Townsend deprivation scores and other census measures to two decimal places for each decennial census 1971 to 2011 at the 2011 Census boundaries. Our plan is to start the linkage as soon as possible and have it completed by August 2016. We plan to start analysis in September 2016 and to write up our research findings from January 2017. We anticipate that the linkage will be completed at the Centre for Longitudinal Studies. We would like the option to be present during the work to ensure we understand how the data are linked and any cause of incorrect matches. Our project team is Dr Paul Norman, University of Leeds, Dr Emily Murray, UCL, a research associate based at UCL yet to be appointed.</p>
