## Introduction

The first sweep of the Millennium Cohort Study ('Child of the New Century') was carried out using computer assisted personal interviewing (CAPI) and computer assisted self-interviewing (CASI). The survey instrument is a computer program written in a software package called Blaise. This document is a paper representation of this computer program.

### Structure of the questionnaire

The CAPI questionnaire for MCS Sweep 1 is divided into modules of questions according to topic. Interviews were conducted with both parents of the cohort baby (where resident). The mother was usually the 'main' respondent and the father or mother's partner was usually the 'partner' respondent. Some modules of the questionnaire were asked to both main and partner respondents; others were asked to only one of them. In this document the heading of each module gives the module title and indicates to which respondent it was asked.

Each module contains a list of all the questions (and answer options) that are included in that module and the routing conditions or 'rules' which govern when a particular question should be asked. In some cases the text of a particular question may be varied automatically to take account of particular circumstances of the respondent using a 'textfill'. These possible different wordings are defined along with the circumstances in which they are used. Most modules also contain edit checks, which highlight to the INTERVIEWER: any inconsistent or unusual answers in order that they can resolve/check them with the respondent. These are referenced in the main part of the documentation and defined in detail in Appendix A.

An example of the layout is given below.

**Example**      *Question (Variable) Name*      *Text of question (including any textfills in italics and interviewer notes in capitals)*

**ADMO**

We would like to know about any health problems for which *^Jack* has been taken to the GP, Health Centre or Health visitor, or to Casualty, or you have called NHS direct. How many separate health problems, if any, has *^Jack* had, not counting any accidents or injuries?

NOTE: RECORD ALL PROBLEMS EVER REPORTED

NO HEALTH PROBLEMS = 0.

Range: 0..97      *Answer options - indicates that the interviewer should enter a number in the range 0..97*

CHECK D12      *Reference to edit check - defined in Appendix (below here)*

*IF there were any problems [ADMO>0]*      *Routing condition or 'rules' governing when question should be asked - described firstly in words then by the logical condition*

|

| **Hpwt**

| *What ^was this problem?*      *Textfill (indicated in italics preceded by ^)*

| 1 Chest infections

| 2 Ear infections

| 3 Feeding problems

| 4 Sleeping problems

| 5 Wheezing or asthma

| 6 Skin problems      *Pre-defined answer categories*

| 7 Sight or eye problems

| 8 Failure to gain weight or to grow

| 9 Persistent or severe vomiting

| 10 Persistent or severe diarrhoea

| 11 Fits or convulsions

| 95 Other health problems

| [maximum 8 codes]

|

| *^was this problem = 'was this problem' if only one problem [DHltProb=1]*

| *'were these problems' if more than one problem [DHltProb>1]*      *Definition of textfill*

| *IF an 'other' problem [HPWT=95]*

|

| **HPWS**

| ENTER OTHER SORT OF HEALTH PROBLEM(S)

| Text: up to 100 characters      *Answer category - indicates that interviewer should enter a text answer of up to 100 characters*

|

| ENDIF

| *Indicates the end of a particular set of routing conditions*

ENDIF

**SOFT CHECK D12:** *IF number of health problems is more than 9 [ADMO>9] 'INTERVIEWER: ^ADMO health problems seems like a lot. Is that right?'*      *Definition of edit check (including whether soft or hard check)*

## Questions and Answers

In CAPI, rather than being numbered, questions are given a unique name – this name is usually derived from the content of the question. In most cases the first letter of the question name indicates in which module the question was asked. Questions are identified by their bold formatting. The text of the question that should be read out by the interviewer is displayed in lower case, with the end of the question usually indicated by a question mark. This may involve the interviewer reading through a list of pre-defined answers. At most questions, the respondent chooses his/her answer(s) from a pre-defined list which is either read out to him/her by the interviewer or which he/she reads from a card given to him/her by the interviewer. At other times the respondent is not offered a pre-defined choice of answer categories, instead the interviewer codes his/her spontaneous response to a pre-defined list of answers. Alternatively the interviewer may be asked to type in the answer given verbatim. At 'text' questions of this type, the number of characters allowed is limited (although interviewers can, where necessary, enter more characters in an electronic memo). At other 'OPEN' questions, there is no limit on the number of characters. Interviewer may also be asked to enter answers in the form of a date, time or number. Notes to help or instruct the interviewer are shown in upper case.

Questions at which a pre-defined list of answers is given can be split into two types: single-coded and multi-coded. Single-coded questions allow only one answer category to be chosen – unless otherwise stated, assume that the question is single-coded. Multi-coded questions are usually identified by a note to the interviewer to 'CODE ALL THAT APPLY'. At some multi-coded questions, the maximum number of codes allowed is less than the number offered. If this is the case, the maximum is stated below e.g. '[maximum 4 codes]'. In addition, at some multi-coded questions, one of the answers may be an 'exclusive code'. This means that if this answer is chosen, no others may be. These codes are identified by '[exclusive code]' after the answer category. Unless otherwise stated all questions also allow 'Don't Know' and 'Refusal' answers to be entered. Where these are not allowed, it is stated below the answers.

At various points in the CAPI program it was necessary to derive variables in order primarily to route respondents correctly to subsequent questions. In particular, several variables were derived from answers given to the household grid. These are listed at the end of the section which documents the household module. In addition, there are some derived variables listed at the beginning of the Module A which indicate key information about the main/partner respondent which is needed for routing through the questionnaire. Derived variables also occur in a number of other modules and are identified as such.

## Routing instructions

Routing instructions are fully detailed in italics at appropriate points. The routing condition is both explained in words and given in terms of the logical command. The expressions '<', '=', '>' are used to denote 'less than', 'equal to' and 'more than'. The term '<>' means 'not equal to'. The routing condition is displayed immediately before the first question to which it applies and is indicated by an 'IF' statement. The end of the influence of a particular routing condition is indicated by an 'ENDIF'. In some cases, where the routing is more complex a routing box is used instead of 'IF' and 'ENDIF' statements to explain when the questions are asked. For example:

ADMX to ADHS repeated for each hospital admission if more than one [ADMA>1]
---

or

CIPR to CICH asked to natural parents only
--

## Textfills

Textfills are used to tailor the question wording to individual respondents circumstances (for example by including the name of their baby or using an answer they have given earlier). Textfills

are indicated by ^ and the use of italics. To aid comprehension the most common version of the textfill has been included in the question text. There are some 'standard' textfills that are used repeatedly throughout the questionnaire. These are defined below:

*^Jack* = 'name of baby' (e.g. Jack) if one cohort baby;  
'name of first baby and name of second baby' (e.g. Sophie and Emily) if two cohort babies; 'the triplets' if three cohort babies; 'the quads' if four cohort babies; 'the quins' if five cohort babies; 'the sextuplets' if six cohort babies<sup>1</sup>. Where questions are asked separately for each baby in a multiple birth, the name of each baby is textfilled.

*^is* = 'is' if one cohort baby; 'are' if more than one cohort baby.

*^was* = 'was' if one cohort baby; 'were' if more than one cohort baby.

*^he* = 'he' if one cohort baby and baby is male; 'she' if one cohort baby and baby is female; 'they' if more than one cohort baby.

*^his* = 'his' if one cohort baby and baby is male; 'her' if one cohort baby and baby is female; 'their' if more than one cohort baby.

*^him* = 'him' if one cohort baby and baby is male; 'her' if one cohort baby and baby is female; 'them' if more than one cohort baby.

*^husband* = 'husband' if respondent is female and is married to another person in household grid; 'wife' if respondent is male and is married to another person in household grid; 'partner' if respondent had a non-married partner in household grid. Note that this is 'blank' if has a part-time resident partner.

*^partner* = 'partner' if respondent had a non-married partner in household grid or a part-time resident partner; 'husband' if respondent is female and is married to another person in household grid; 'wife' if respondent is male and is married to another person in household grid.

Other textfills are used at particular questions or modules. These textfills are defined below the first question in which they are used. In some cases, the most common value of the textfill may be blank i.e. words are inserted into a question only in particular circumstances. In these cases the wording of the textfill is included in the question as normal but enclosed in brackets to indicate that it does not commonly occur.

## Checks

An advantage of CAPI questionnaires is that checks can be included in the program to alert interviewers when an unlikely or impossible response has been entered. Hard checks can be used to prevent logical inconsistency (for example so that a child cannot be older than is/her parents). In such circumstances, a warning screen is raised to alert the interviewer to the problem. Hard checks cannot be bypassed by the interviewer, who must identify the problem and resolve the discrepancy before proceeding. Soft checks are used to bring improbabilities to the attention of the interviewer. For example, if the birth weight of the baby is higher or lower than expected. The interviewer is instructed to investigate the improbable answer and make any necessary corrections. If the interviewer is confident that the information given is correct, they may suppress the warning and continue with the interview. Checks are referenced at the question at which they occur and specified in detail in Appendix A

---

<sup>1</sup> Although the program allowed for up to 6 babies, there were no quads, quins or sextuplets in the achieved Sweep 1 sample.

## Using this questionnaire with the data

The data collection for Sweep 1 of the Millennium Cohort Study was carried out using a Blaise CAPI questionnaire. Additional coding and editing were done on the Blaise data post-fieldwork and then the Blaise data was converted into SPSS.

As explained above, at some questions respondents were given the opportunity to choose an 'other' answer and have this answer entered as text by the interviewer. Also at 'Open' questions, the interviewer entered the answer as text. These 'other' and 'Open' text answers have been coded. Questions which were coded post-field are indicated with a bold asterisk (\*) in this document. For single coded questions which were coded post-field, the code given to the 'other' answer overwrites the 'other' code chosen originally and the variable name in the data is the same as the CAPI program. For multi-coded variables which were coded post-field, the code or codes given to the 'other' answer were added to any originally chosen by the respondent and the combined codes are stored in differently named variables in the data. In this document, the names of these variables are shown in brackets after the original question name. All answers to text questions of this kind have been coded and the original text has been removed from the data. Further details of the coding and editing can be found in the accompanying Code Book.

After coding and editing, the Blaise data was transferred into SPSS. Generally the SPSS variable name is the same as the CAPI question name listed in this document. For questions which were asked to both main and partner respondents, the partner variable in SPSS is usually suffixed with a '2'. The variable label also indicates this clearly. For multi-coded questions, variables are suffixed with a number from '1' or '01' thru to the maximum number of responses for that question. In order to allow the 'other' answer that respondent's gave more than one code, the maximum number of codes for multi-coded questions was extended for most questions at the edit stage. For this reason, at multi-coded questions the number of variables in the data is usually higher than the number of codes originally allowed in the CAPI. The number of codes originally allowed in the CAPI are detailed in the Questionnaire Documentation. Answers are stored in these variables in order of mention. For questions which are repeated for each baby in a multiple birth, the variable name for the second baby is suffixed with a '2' and the third with with a '3'. For these questions, the variable label also indicates clearly to which baby it refers. Further details about the variables contained in the data can be found in the accompanying Data Dictionary.
