User guide to the data

October 2012
NCDS 2008-2009 Follow-Up Team

The NCDS 2008-9 follow-up was designed and conducted by a joint team drawn from CLS and the National Centre for Social Research (NatCen). The key members of the team are listed below:

**CLS Team**

*Research Design and Implementation*  
Jane Elliott, Peter Shepherd, Matthew Brown, Lisa Calderwood, Maggie Hancock, Brian Dodgeon, Samantha Parsons

*Cohort Studies Administration*  
Denise Brown, Kevin Dodwell

*Tracing Unit*  
Kevin Dodwell, Mary Ukah, George Andrew, Peter Deane

*Database Team*  
Robert Browne, Denise Brown, Jon Johnson, Maggie Hancock

**NatCen Team**

*Research Design and Implementation*  
Marie Thornby, Elizabeth Hacker, Caroline Killpack, Carli Lessof, Reg Gatenby, Suneeta Bhamra, Richard Boreham

*Field administration*  
Coral Lawson, Helen Selwood, Janice Morris, Mercedes Damm

*CAPI/CASI Programming*  
Nafiis Boodhumeah, Peyman Damestani, Richard Akers, Sue Corbett

**Acknowledgements**

We would like to thank a number of people for their contribution to the National Child Development Study 2008-2009 survey.

Firstly, we would like to thank all the cohort members, who generously gave their time to participate in this project and without whom this survey would not have been possible.

At the Centre for Longitudinal Studies and the National Centre for Social Research (NatCen), we would like to thank all those members of the administration, tracing and IT teams named elsewhere in this Guide, and the interviewers who worked on this study, and greatly contributed to the success of the fieldwork.

The work could not have been carried out successfully without the involvement of the many advisors drawn from researchers, policy makers and funders, who we consulted throughout the design of the surveys.

We wish to acknowledge the support for this follow-up of our principal funders: the Economic and Social Research Council.
PREFACE

Data from the 2008-9 follow-up of the National Child Development Study has been deposited with the UK Data Archive at the University of Essex in stages. This document has been prepared to accompany the final deposit.

The elements of the deposit, to which reference will be made throughout this document, are identified below. Users are advised that they will need to consult all elements of the documentation to gain a full understanding of the data.

The Centre for Longitudinal Studies (CLS) request that any work which is based wholly or in part on analysis of National Child Development Study data includes the following acknowledgement:

“The analyses in this work are based wholly or in part on analysis of data from the National Child Development Study (NCDS). The data was deposited at the UK Data Archive by the Centre for Longitudinal Studies at the Institute of Education, University of London. NCDS is funded by the Economic and Social Research Council (ESRC).”

CLS also request that the term ‘NCDS’ be included when compiling keywords to accompany any publications based on analysis of the study’s data.

1. Introduction

The 2008/9 follow-up of the National Child Development Study (NCDS) ran from August 2008 to May 2009. The survey partially overlapped with a telephone follow-up of the 1970 British Cohort Study (1970 cohort). The NCDS survey was designed by the Centre for Longitudinal Studies of the Institute of Education, University of London (CLS), and the fieldwork was carried out by the National Centre for Social Research (NatCen). The work was funded by the Economic and Social Research Council.

In total 12,316 cohort members were issued to interviewers and 9,790 were interviewed.

In March 2009 an interim dataset was deposited, based on 2,997 interviews completed between August and December 2008. This dataset was comprised of a subset of the full list of variables. Data from the full sample is now being deposited at the UK Data Archive (University of Essex) in stages.

In March 2010 a first dataset was deposited. This dataset included responses to the bulk of the questions put to cohort members in 2008/9. Variables which required complex post-fieldwork editing were not included.

This document accompanies the final deposit which includes responses to all the questions put to cohort members in 2008/9 (with the exception of open-text variables). Variables available here for the first time are:

- Those which relate to the four ‘history’ modules – housing history, relationship history, fertility history and economic activity history
- Variables relating to absent children
- Variables relating to older children
- Specific details relating to recently achieved qualifications

1.1 NCDS Background

NCDS started life as the Perinatal Mortality Survey, which was designed to examine the social and obstetric factors associated with stillbirth and infant mortality. In the first survey, data were collected about the births and families of 17,638 babies born in Great Britain during one week in March 1958. There have subsequently been a further eight surveys which have sought to gather information from respondents living in England, Scotland and Wales, in order to monitor their health, education, social and economic circumstances.

These surveys were carried out in 1965 (age seven), 1969 (age eleven), 1974 (age sixteen), 1981 (age 23), 1991 (age 33), 1999/2000 (age 42), 2004/2005 (age 46) and 2008/2009 (age 50). As part of the 1991 survey, information was additionally collected from co-resident partners and for a third of the sample data was also collected from any co-resident natural or adopted children of the cohort member.

Surveys of sub-samples of the cohort took place in 1976 (age 18), 1978 (age 20) and 1995 (age 37). The most recent sub-study, in 1995, involved conducting basic skills assessments with 10% of the cohort.

In addition, a ‘Biomedical Survey’ was conducted in 2002/3 which sought to obtain objective measures of ill-health and biomedical risk factors.

---

1 Separate datasets covering employment histories and partnership histories between 1974 and 2008 have recently been deposited at the UK Data Archive along with full documentation.
The 2004/2005 survey took the form of a 30 minute telephone interview which focused on updating the key changes in circumstances which had been experienced by cohort members in the time that had elapsed since their last interview.

The 2008/2009 survey was comprised of two parts: a ‘core’ face-to-face interview and a paper self-completion questionnaire. As in all recent follow-ups the main aim was to update information gathered in previous surveys in order to explore the factors central to the formation and maintenance of adult identity in each of the following domains:

- Lifelong learning
- Relationships, parenting and housing
- Employment and income
- Health and health behaviour
- Citizenship and values

### 1.2 Survey Design

A number of organisations were involved in the development and delivery of the 2008/2009 follow-up.

**Centre for Longitudinal Studies (CLS)** – CLS are an ESRC resource centre based at the Institute of Education, University of London and have been responsible for the study since 1991. CLS were responsible for the development of the 2008/2009 survey and commissioned the fieldwork.

**Funders** – The 2008/2009 survey was funded by the Economic and Social Research Council (ESRC).

**Advisors** – The content and design of the 2008/2009 survey was developed in collaboration with a number of advisory panels comprised of researchers, policy-makers and funders.

**Fieldwork subcontractors** – Following competitive tendering, the National Centre for Social Research (NatCen) were selected to conduct the 2008/2009 survey on behalf of CLS. NatCen assisted CLS with the development of instrumentation, conducted the fieldwork and carried out initial data preparation (including coding and post field editing) and documentation. NatCen also conducted the follow-ups in 2000 and 2004/2005.
2. Survey instruments

The 2008/2009 survey was comprised of the following elements:

1. A 55 minute ‘core’ interview which included:
   a. Computer Assisted Personal Interview (CAPI) – 40 minutes
   b. Computer Assisted Self Interview (CASI) – 10 minutes
   c. A series of cognitive assessments – 5 minutes

2. A paper self-completion questionnaire

The paper self-completion questionnaires were (in most cases) posted to cohort members once the interviewer had arranged an appointment to conduct the core interview. In the majority of cases cohort members had then completed these questionnaires in advance of their core interview, meaning that they could be collected by the interviewer when they visited.

In addition, cohort members completing the survey were also asked for their consent to link their responses with administrative data held by DWP and NHS and if applicable to provide their consent for CLS to approach their parents about a possible study concerned with examining inter-generational transfers and relationships between cohort members and their parents².

More detail about each of these elements is provided below.

---

² For more information about the paper self-completion questionnaire see Elliott and Brown, 2011 (www.cls.ioe.ac.uk/ncds8datanotes)
3. Survey content and key variables

Many of the questions in the 2008/9 follow-up interview had been asked in earlier waves of the NCDS and the BCS, which will allow for the making of comparisons both across the sweeps of NCDS and with the BCS cohort. There were, in addition, a number of new areas of data collection including a new module covering symptoms of the menopause and a series of cognitive ability tests.

Table 1 below lists some of the key variables included in this deposit. The majority of these variables were also included in the Age 46 survey -NCDS7 (variable names are listed where applicable).

The case identifier used on the file is ‘ncdsid’ which replaces the old case identifier ‘serial’. In August 2008, all historic NCDS datasets were re-deposited at the UK Data Archive with the old case identifier 'serial' replaced by a new identifier 'ncdsid'. This identifier can be used to link the data longitudinally to earlier sweeps.

The reason for changing the case identifier was to improve the security of the data and increase safeguards on the confidentiality of cohort members.

All datasets carrying the old serial numbers should normally be deleted within three months of receipt of the revised data by the researcher.

Further information on this may be found in the ‘CLS Confidentiality and Data Security Review’, included in the documentation available via ESDS.

</table>

A broad summary of the content of the 2008/9 follow-up interview and self-completion questionnaire is provided in sections 3.1 to 3.4.
3.1 Core CAPI interview:

The CAPI interview collected updated information about household composition, housing, relationships, births and other pregnancies, periods of lone parenthood, adopted children, absent and older children, parents, family income, economic activity, education and qualifications, work-related training, use of computers, health, smoking, drinking, exercise, height, weight, social participation and social support.

3.2 CASI interview:

The CASI interview collected information on voting behaviour and party support, experience of symptoms of the menopause, problematic drinking behavior, well-being, relationship satisfaction, domestic division of labour, job commitment, attitudes towards pensions and retirement, childhood, efficacy and life satisfaction.

The CASI interview included several established scales which are listed below along with the variables of which they are comprised. Overall scores for each scale have also been derived and included within the data deposit. Additional information about the derivation of these overall scores and copies of the syntax used can be found in Appendix 2.

3.2.1 Kanungo’s Job Involvement Scale

The survey included four items from a ten-item scale developed by Kanungo (1982) as used by Frone and Rice (1987) to measure job involvement which is defined as ‘psychological identification with a job’. The scale measures the extent to which one sees their job as an important part of their self-concept. A derived overall score is provided in nd8jobin. Scores range between 1 and 6 with higher scores indicating higher levels of job involvement.

<tr>
<td>nd8jobin</td>
<td>(Derived) Overall job involvement score (1-6)</td>
</tr>
</tbody>
</table>

3.2.2 AUDIT (Alcohol Use Disorders Identification Test)

The AUDIT test replaces the CAGE scale as a measure of problematic alcohol consumption. The AUDIT consists of 10 questions covering alcohol consumption, problems and dependency. Responses to each question are scored from 0 to 4 giving a maximum score of 40 (nd8audit). Scores of 8 or more are associated with harmful or hazardous levels of drinking; scores of 13 or more for women and 15 or more for men are likely to indicate alcohol dependence. A derived variable (nd8audg) is provided which identifies those allocated to either of these groups.
### 3.2.3 Malaise inventory

The survey included a set of 24 self-completion questions which combine to measure levels of psychological distress, or depression (Rutter et al, 1970). The 2008-9 follow-up used 9 of the original 24 items.

### 3.3 Cognitive assessments:

The cognitive assessment module was comprised of four tests as described below. Variable names and variable labels are provided for reference.

#### 3.3.1 Word list recall

A test of verbal learning and recall was included where participants were required to learn a list of 10 common words. The CAPI program randomly selected one of four lists of words which were presented to the respondent by the computer using a recorded voice. In cases where the computer voice was not audible the list was read aloud by the interviewer, who was asked to imitate the pace and clarity of the recorded voice, reading the words at approximately 2 second intervals.
Once the list had been read out, cohort members had up to two minutes to recall as many as they could. Interviewers made a note of each word correctly recalled and entered the total into the CAPI program.

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Variable label</th>
</tr>
</thead>
<tbody>
<tr>
<td>n8CfLisn</td>
<td>Number of words correctly recalled</td>
</tr>
</tbody>
</table>

### 3.3.2 Animal naming

The second cognitive test was a test of verbal fluency which measured how quickly participants could think of words from a particular category, in this case naming as many different animals as possible within one minute. Interviewers made a note of each named animal and entered the total into the CAPI program. Repetitions, named animals (e.g. Bambi) and redundancies (e.g. white cow, brown cow) were excluded from the total score.

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Variable label</th>
</tr>
</thead>
<tbody>
<tr>
<td>n8CfAni</td>
<td>Number of animals mentioned</td>
</tr>
</tbody>
</table>

### 3.3.3 Letter cancellation

The letter cancellation test measures attention, mental speed and visual scanning. Participants were given a page of random letters of the alphabet and asked to cross out as many “Ps” and “Ws” as possible within one minute. Two scores were calculated: speed and accuracy. The ‘speed’ score was measured by the total number of letters scanned, the ‘accuracy’ score was measured by the number of Ps and Ws which were scanned but missed.

<table>
<thead>
<tr>
<th>Variable name</th>

<td>Letter cancellation speed score: Total num letters scanned</td>
</tr>
<tr>
<td>n8cfmis</td>
<td>Letter cancellation accuracy score: Num Ps &amp; Ws missed(0-65)</td>
</tr>
</tbody>
</table>

### 3.3.4 Delayed word list recall

The final test was a test of delayed memory which asked the participant to recall as many words as they could from the original list presented to them during the first word-recall task. The word lists were not repeated and participants had again two minutes to recall as many as they could. Interviewers made a note of each word correctly recalled and entered the total into the CAPI program.

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Variable label</th>
</tr>
</thead>
<tbody>
<tr>
<td>n8cflisd</td>
<td>Number of words recalled after delay</td>
</tr>
</tbody>
</table>

### 3.3.5 Comparability of cognitive assessments with other studies

When conducting the cognitive assessments interviewers working on the 2008-9 follow-up followed exactly the same procedures as were employed by interviewers working on the English Longitudinal
Study of Ageing (ELSA) (http://www.ifs.org.uk/elsa/) and as such the data collected by the two studies will be directly comparable.

Word-list recall exercises and the letter cancellation task have also been included in the 1946 cohort study (the National Survey of Health and Development) (http://www.nshd.mrc.ac.uk/nshd.aspx). There are however a number of small differences in protocol which will have an impact on the comparability of results:

- The word list recall exercise asks 1946 cohort members to recall 15 words, whereas ELSA and NCDS ask respondents to recall 10 words.

- In the 1946 study word list recall exercise the words are shown to the respondent in a flip book (at intervals of two seconds) whereas in the ELSA/NCDS exercise the words are read to the respondent by the computer (unless respondent unable to hear well in which case the words are read by interviewer). A person’s ability to recall words which they have read may differ from their ability to recall words which they have heard spoken.

- In the 1946 study, respondents are asked to recall the words on 3 occasions, whereas ELSA/NCDS respondents are only asked to recall the words twice. On the 1946 study, once the word-list recall task has been completed for the first time it is immediately repeated a second time whereas on ELSA the task is only completed once at first. Each of the studies then include a delayed word-list recall exercise but the 1946 respondents will be at an advantage as they will have had an extra opportunity to commit the words to memory.

- 1946 cohort members are given one task between the original word list recall exercise and the delayed word-list recall exercise (the letter-cancellation task) whereas ELSA/NCDS respondents are given two tasks (the letter-cancellation exercise and the animal naming exercise).

The word-list recall exercises (immediate and delayed) were also included in the 1993, 1995, 1996, 1998, 2000, 2002 and 2004 sweeps of the Health and Retirement Study (HRS) (http://hrsonline.isr.umich.edu/). The protocols followed by interviewers working on the HRS were exactly the same as those working on NCDS and ELSA, meaning the data collected by each of the studies will be comparable. The only difference is that between the immediate word-list recall exercise and the delayed word-list recall exercise the HRS has included 5 minutes of questioning rather than additional cognitive assessments as included in ELSA/NCDS.
3.4 Paper self-completion:

The paper self-completion questionnaire collected information on leisure activities, personality type, health, sleep, values and attitudes, sense of community and quality of life. In addition, cohort members were asked an open question where they were asked to write about the life that they imagined they would be living at the age of 60. This qualitative data has been transcribed and anonymised and is deposited separately.

The paper self-completion included several established scales. As mentioned above, overall scores for each scale have also been derived and included within the deposited data. Additional information about the derivation of these overall scores and copies of the syntax used can be found in Appendix 2.

3.4.1 Personality Inventory

The self-completion questionnaire included 50 questions from the International Personality Item Pool (IPIP) (Goldberg, 1999). Responses can be summed to provide scores on the so called ‘Big-5’ personality traits: extraversion, agreeableness, conscientiousness, agreeableness and intellect. Scores on each trait range between 10 and 50 with higher scores equating to higher levels of each trait.

**NOTE:** The derived variables nd8ext, nd8agr, nd8con, nd8emo and nd8int which are included in the deposited data were incorrectly derived and will be re-deposited as soon as possible. In the meantime users are advised to re-create these variables using the syntax provided in Appendix 2 Section A.

3.4.2 Warwick-Edinburgh Mental Well-Being Scale (WEMWBS)

WEMWBS is a 14 positively worded item scale with five response categories. It covers most aspects of positive mental health (positive thoughts and feelings) including both hedonic and eudaimonic perspectives (Tenner et al, 2007). Scores range between 14 and 70 and higher scores indicate higher levels of well-being.

3.4.3 SF-36

SF-36 is a widely used multi-purpose health survey comprised of 36 questions. It yields an 8-scale profile of functional health and well-being scores as well as psychometrically-based physical and mental health summary measures and a preference-based health utility index (Ware, Snow, Kosinski, & Gandek, 1993).

Each of the 8 scales are scored between 0 and 100 with higher scores indicating higher levels of health.

3.4.5 CASP-12 / 14

CASP-12/14 is a scale designed to measure quality of life in the ‘third age’ by using Likert-scaled questions which cover four theoretical domains: control, autonomy, self-realisation and pleasure. The 2008-9 follow up used 14 items from the full 19 item scale (Wiggins et al, 2004) summary scores based on both 12 and 14 items are included in the dataset. Users are encouraged to use CASP-12 as this is the recommended variable for analysts (Wiggins, 2008). Scores range between 0 and 36 for the 12 item score and between 0 and 42 for the 14 item score, with higher scores indicating higher levels of well-being.

4. **NCDS 2008-9 Followup Dataset**

The dataset for the NCDS 2008-9 follow-up has been supplied to the UK Data Archive in the form of an SPSS dataset as follows:

National Child Development Study - Data collected in 2008/9 (at age 50)

Details of the CAPI/CASI program and copies of paper questionnaires may be found in the following, which also accompany the data deposit:

- NCDS 2008-2009 Follow-up: Questionnaire Documentation
- NCDS 2008-2009 Follow-up: Self-completion Questionnaire

All variables from the paper self-completion questionnaire have been included in the data set, with the exception of answers to Q21, an open question asking cohort members to imagine that they are 60 years old and to write a few lines about the life they are leading. This is available as a separate deposit.

Additional information about the variable names, labelling of variables and about CASI variables, cognitive assessment variables, paper self-completion variables, identifiers and derived variables is given below.

**4.1 Variable names**

As noted above, the core interview (including the cognitive assessment module) was conducted using CAPI and CASI and as such the variable names in the dataset are based on those automatically allocated by the CAPI program (Blaise).

Within the Blaise programming code, each question has a variable name (rather than number), made up of a maximum of 8 characters, and this is used as the root of the variable name on the dataset. Where the question is repeated (eg: the same question is asked for each birth, relationship, job, qualification, etc. reported), Blaise automatically allocates a number suffix (eg: name, name2, name3, name4).

Unfortunately, where the variable name in the Blaise program was originally more than 6 characters long, Blaise truncates the name to allow for the suffix. As a result, there is not always a simple match between the Blaise program documentation and the data. To facilitate matching between dataset variables and CAPI questions, variable labels are prefixed by the CAPI name.

As many of the questions asked in the core interview were identical to the questions asked in the 2004/5 sweep the variable names allocated by Blaise were also identical. In order to ensure that variable names in the 2008/9 data are different to those in the 2004/5 data, all variables in the 2008/9 data set have been given the prefix n8. In some cases the variable names have also been truncated in order to limit the name to 8 characters. Where a variable was included in the 2004/5 sweep the variable name has, as far as possible, been kept identical for the 2008/9 sweep although prefixed with “n8” rather than “n7”.

<table>
<thead>

<tr>
<td>nd8csp12</td>
<td>(Derived) Overall CASP-12 Quality of Life Score</td>
</tr>
<tr>
<td>nd8csp14</td>
<td>(Derived) Overall CASP-14 Quality of Life Score</td>
</tr>
</tbody>
</table>
In addition it should be noted that a number of derived variables have been included in the deposited dataset. Names of these variables are given the prefix “nd8” and variable labels are given the prefix “(Derived”). A list of all derived variables in this deposit is provided in Appendix 1.

A number of variables are automatically derived within the CAPI program. These variables have the usual “n8” prefix but the variable labels are “prefixed” or “suffixed” with “(Recoded)”

Variables from the paper self-completion questionnaire are derived from the question numbers as they appear on the printed questionnaire and prefixed with “n8sc”. They have the following form: n8scq1a, n8scq1b, n8scq2a, n8scq2b etc.

**4.2 Variable labels**

The variable labels included in the dataset relating to the core interview are also initially derived from the CAPI/CASI program. In exporting the SPSS dataset from Blaise, labels based on the wording of questions were automatically allocated. The variable labels have been individually reviewed. Where necessary, labels have been modified in an effort to ensure that labels are comprehensible and accurate.

Variable labels for the data derived from the paper questionnaire have been derived from the question wording used on the printed questionnaire.

**4.3 Value labels**

The value labels are similarly derived from the Blaise program or printed questionnaire. Value labels have been individually reviewed and amended, where necessary.

**4.4 Missing values**

Missing values are consistently labelled as follows (unless otherwise stated):

-9 = Refusal  
-8 = Don’t Know  
-2 = Schedule not applicable  
-1 = Item not applicable

For some variables, additional missing values may occur. They will be in the range -3 to -6 and have been labelled to indicate the reason the data is missing.

**4.5 Variable order**

The order in which variables appear in the dataset broadly follows the order of sections, and of questions within sections, of the survey instruments – CAPI/CASI or paper. However, for the core interview elements (CAPI, CASI, cognitive assessments) the order is determined by the structure of the Blaise program, which does not necessarily hold each question in the order in which they are put to the respondent. This change in order is typically, but not exclusively, associated with question sequences which are repeated to produce grid-like data structures (eg: birth, relationship, job, qualification histories etc).
4.6 CASI Self-completion

The CASI self-completion was administered toward the end of the core interview. The interviewer handed the laptop computer used for the interview to the cohort member and explained how they should complete the questionnaire. Where the cohort member was unable or reluctant to use the laptop, the interviewer assisted, and if necessary administered the self-completion as an interview. The variables which hold the data for the CASI self-completion are given the prefix “CASI”.

4.7 Relationship histories

The relationship history module sought to collect a complete record of all cohabiting relationships within the appropriate reference period. It should be noted that researchers wishing to examine cohort members’ relationships are advised to use the NCDS Partnership Histories dataset deposited at the UK Data Archive. This dataset currently contains data for the cohort members’ partnerships for the period 1974 to 2008.

Post-fieldwork editing and cleaning of the relationship history data collected in the previous sweep of the study (the 2004-5 follow-up) revealed that there were a few problems with the routing of the questions in this module which lead to flaws in the information obtained about the period between the 1999/2000 follow-up and the 2004/5 follow-up. Details of the problems are provided below:

1. Cohort members who were cohabiting at the time of the 1999/2000 follow-up and also cohabiting at the time of the 2004/5 follow-up but with a different partner, were not asked about the end of the relationship they were having with the person they were cohabiting with at the time of the 1999/2000 follow-up.

2. A number of cohort members who were cohabiting at the time of the 2004/5 follow-up, reported that their current partner was the same partner that they had at the time of the 1999/2000 follow-up, but at the time of the 2000 survey reported not having a partner.

3. When recalling details about previous partnerships, cohort members who were not married at the time they moved in with an ex-partner but who subsequently did get married, were not asked whether they got divorced or when.

4. In both the 1999/2000 follow-up and the 2004/5 follow-up there were a number of cohort members who reported being married or living with their current partner in the relationship history module but did not report a spouse or partner in the household grid.

5. There were also a number of cohort members with missing information about their marital and/or legal marital status at the time of the 1999/2000 follow-up or the 2004/5 follow-up.

Cases where any of the above applied were flagged as ‘repair cases’. A revised introduction to the relationship history module was triggered for these cases where it was explained that when they were interviewed as part of the 2004/5 follow-up there was a problem with the data that was collected about their relationship history and that as a result it was necessary to recollect. These cohort members were then asked for a full relationship history from the date of their 1999/2000 follow-up interview through to the date of their 2008/2009 follow-up interview.

The raw relationship history data as collected is not included in this deposit. The data has been presented as ex-partner variables, current partner variables and new partner variables.
Ex-partner variables relate to spouses or civil partners that the cohort member had separated from at the time of the last interview (or 2000 if repair case) but had not divorced or legally dissolved their relationship.

<table>

</tbody>
</table>
4.8 Unfolding Brackets

A feature of the income questions (benefit income, gross and net) in NCDS8 is the use of a series of questions referred to as ‘unfolding brackets’ which are triggered if a respondent refuses or is unable to provide an exact answer. The questions are designed to elicit a minimum and maximum value which define a range or “closed band” within which the actual value lies.

On entering the unfolding brackets, respondents are asked to say whether they have more, less or about the same as a particular value. This question is repeated using different values (which will be a lower or higher value depending on the answer to the preceding question).

The procedure stops at the point when either an upper and lower bound is provided, the respondent refuses or says “don’t know”, or the respondent places themselves in the top or bottom bracket.

The unfolding bracket questions are randomly ordered for each respondent such that any possible 'anchoring' effects (i.e. where people use the suggested figure as a reference point and make adjustments to it to reach their answer) from the procedure are averaged across the distribution, and the bracket values are selected on the basis of the density of the underlying financial variable.

Unfolding brackets were used on the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable name</th>
<th>Number of cohort members</th>
</tr>
</thead>
<tbody>
<tr>
<td>Benefit income</td>
<td>N8IAA01-N8IAA21</td>
<td>Unfolding brackets entered for 18 of the 21 benefits listed. Number of cohort members range from 2 (for guardians allowance) to 496 (for child benefit)</td>
</tr>
<tr>
<td>Other regular sources of income</td>
<td>N8INCSRCE</td>
<td>830</td>
</tr>
<tr>
<td>Total savings</td>
<td>N8SAVTOT</td>
<td>1760</td>
</tr>
<tr>
<td>Net earnings from employment</td>
<td>N8CNETPY</td>
<td>402</td>
</tr>
<tr>
<td>Gross earnings from employment</td>
<td>N8CGROPY</td>
<td>861</td>
</tr>
<tr>
<td>Net profit from self-employment</td>

<td>N8SEEARN</td>
<td>360</td>
</tr>
<tr>
<td>Income from ‘other’ jobs</td>
<td>N8OJNETW</td>
<td>59</td>
</tr>
</tbody>
</table>
A detailed description of the use of unfolding brackets for the variables listed can be found in Appendix 3.

The unfolding bracket variables have not been included in this deposit but are available in a separate file available from the archive.

### 4.9 Reference dates for retrospective data/histories

The 2008/9 follow-up gathered retrospective information on housing situation, relationships, pregnancies, economic activity and qualifications. The majority of cohort members had participated in one of the last two follow-ups which took place in 1999/2000 and 2004/5. For such cohort members the reference date for retrospective questions was the date of their last interview. For the small number of cohort members (n=372) who had not participated in either of these follow-ups the reference date was generally the 1st January 2000; the exception to this was the pregnancy history module which for these cohort members used their 16th birthday as the reference date so that a full pregnancy history was collected.

### 4.10 Occupational coding of employment data

All occupational coding of employment data was carried out by NatCen with the exception of of RGSC (Registrar Generals Social Class 1991) and SEG (socio-economic group) for partner’s job. The occupational coding for RGSC and SEG for partner’s job was carried out by CLS using the SOC2000 codes and lookup tables downloaded from the CAMSIS website (www.camsis.stir.ac.uk).

### 4.11 Derived variables

A number of derived variables (including the overall scores from the various scales employed in the questionnaire) have been included in the dataset. The variable names all have the prefix ‘ND8’ and the variable label are endorsed ‘(Derived)’. A full list is provided in Appendix 1.

### 4.12 Errors / inconsistencies

The use of CAPI/CASI should ensure that all filters have been correctly followed within the datasets relating to these elements of the core interview, and that the data is consistent throughout. However, post-fieldwork checking of the data has uncovered a small number of errors and inconsistencies. In addition, a small number of problems have been identified in terms of the wording of questions put to cohort members.

These errors and inconsistencies are documented here.

#### 4.12.1 Errors

1) **Batch 2 feed-forward data**

A technical error which occurred as the second batch of feed-forward data was loaded caused 25 cohort members to be routed past certain blocks / variables. The blocks/variables which these cases were not routed to (and as a result have ‘-6 misrouted’ values for these block intro variables/ variables in the data) are as follows: IntWho, HlthGen, KHIStat, MHProbs, Cognitive Function block, Smoking & Drinking
To provide full details about their net and gross income from employment were asked a series of questions known as ‘unfolding brackets’. These questions are designed to elicit a minimum and maximum value which define a range or “closed band” within which the actual value lies (see questionnaire documentation for further details). All cohort members who refused/did not know or gave an ‘other’ period at cnetprd, cgroprd or pnetprd should have been asked the relevant unfolding bracket questions about the income they receive monthly, but 40, 33 and 53 cases were not routed to the unfolding bracket questions for cnetprd, cgroprd or pnetprd respectively. The 'other period' unfolding bracket variables, ‘entry point’ and ‘result’ have been coded as -6 (misrouted away from unfolding brackets questions) and the 'other period' unfolding bracket variables for ‘minimum value’, ‘maximum value’ have been coded as -8 (don’t know) for these cases.

5) **Menopause block**

11 cases were not routed to this module due to a problem with the ‘Gender’ variable at the start of fieldwork. This error was rectified on the first day of fieldwork but a number of interviews had already taken place. Variable N8MENINT is coded -6 (misrouted away from menopause block) for these 11 cases.

6) **Cognitive function block**

**Letter Cancellation**

The letter cancellation task was completed on paper, in the cognitive assessment booklet. This booklet should have been returned to NatCen for scoring. In 151 cases the task had not been completed properly meaning the test could not be scored; in other cases the booklets were either not returned or were lost in the post meaning that the number of tests recorded as complete by the interviewer (n=9,593) is higher than the number of actual scores (n= 9,442). Variables N8CFROW, N8FCOL, N8CFCOR, N8CFMIS, N8CFTOT, N8CFRC have been coded -6 (Test forms not completed/received) for these 151 cases.
Delayed Word-List Recall

Several interviewers did not conduct the delayed word-list recall test correctly. The result of this is that 57 cohort members coded as completing the cognitive function module (CFINT=1) have no score on this particular test (CFLisD). Variable N8CFLISD has been coded as -6 (delayed memory test not performed) for these 57 cases.

4.12.2 Inconsistencies

In order to minimise post-interview editing, data entered into the CAPI program was automatically subjected to a large number of consistency error checks. These checks comprised of ‘hard’ checks and ‘soft’ checks. Hard checks must be resolved by the interviewer at the time of the interview, but soft checks could be suppressed by the interviewer. Where a soft check was suppressed, interviewers were instructed to record a note explaining the situation which could be inspected later during the editing process. As would be expected in a study with such a large sample size there are instances where this did not happen which has lead to some inconsistencies.

For example, a small number of cohort members state in the household grid that a partner living in the household at the time of last interview is no longer there but in the relationship history module state that they are still living with this person. There are also some instances where the name of the current partner recorded in the household grid does not match the name of the current partner recorded in the relationship history module. There are also some inconsistencies in terms of the data collected about pregnancies and births, for example, a small number mention a recently born child in the household / absent child grid but do not provide details of this child in the pregnancy block (and vice-versa).

4.12.3 Question wording problems

AUDIT

The first official AUDIT question covering regularity of drinking has a five point scale (Never, Monthly or less, 2-4 times a month, 2-3 times a week, 4 or more times a week). This question was replaced with variable ‘n8drinks’ in the Smoking and Drinking module; n8drinks had an eight point scale (On most days, 2 to 3 days a week, once a week, 2 to 3 times a month, once a month, less often or only on special occasions, never nowadays, never had an alc. drink). The variable ‘n8drinks’ was recoded to match (as closely as possible the first AUDIT question).

However, an error in the programming of the CASI module meant that the wording of the answer codes for n8Audi02 to n8Audi08 differed slightly from the official version of the AUDIT questionnaire.

AUDIT questions 2 to 8 use the following codeframe: Never, Less than monthly, Monthly, Weekly, Daily or almost daily. However the programming error meant that questions n8audi02 to n8audi08 used the following codeframe: Never, Less than monthly, Monthly, Two to three times a week, Four or more times a week. When calculating overall AUDIT scores ‘two to three times per week’ has been treated as ‘weekly’ and ‘four or more times a week’ has been treated as ‘daily or almost daily’.

The two code-frames are roughly comparable but the differences could affect the way the questions were answered meaning AUDIT scores may not be strictly comparable to AUDIT scores collected using the official wording.
Attitudes to Pensions and Retirement

The CASI module included six questions on attitudes to pensions and retirement which were taken from the DWP’s Attitudes to Pensions survey which took place in 2006: n8pensec, n8penwrk, n8worret, n8affsvr, n8rtfaro and n8enouic. The DWP survey used a five-point scale for these questions (strongly agree, agree, neither agree nor disagree, disagree, strongly disagree) but an error meant that NCDS cohort members were asked to answer using a six-point scale (strongly agree, agree, somewhat agree, somewhat disagree, disagree, strongly disagree etc.). As such responses to the two surveys may not be entirely comparable.

4.13 Further information

Queries about any aspect of the data should be sent to CLS using the feedback page on the CLS website: www.cls.ioe.ac.uk/feedback.
5. Survey development and piloting

Each element of the 2008/9 follow-up was rigorously tested prior to the commencement of main-stage fieldwork.

5.1 First pilot

A first pilot took place between the 28th November and the 24th December 2007 with specially recruited members of the public aged 46-55 in 12 areas. This first pilot comprised the first test of the questions and accompanying procedures for both the ‘core’ interview and the paper self-completion questionnaire. The pilot sought to measure the length of the interview and to identify any routing or filter errors within the program. It was also important to identify any problematic questions (in terms of comprehension or sensitivity) and any administrative or procedural difficulties.

65 individuals completed the ‘core’ interview (CAPI interview, CASI interview and cognitive assessments) and 42 individuals completed the paper self-completion questionnaire.

The pilot was generally very successful and both the core interview and the paper questionnaire were well received. The key issue was that the core interview was considerably longer than its target length, and as such substantial cuts were required in advance of the second pilot or ‘dress rehearsal’.

5.2 Dress Rehearsal

The dress rehearsal took place in 8 areas between the 7th April and the 8th May 2008. It was intended as a test of all changes made as a result of the pilot stage and as a full procedural test of all survey instruments, documents and procedures prior to main stage fieldwork. The dress rehearsal took place with actual cohort members so that in addition to further testing of the elements above it was possible to test contacting and tracing procedures.

In total 77 cohort members completed a core interview, of whom 72 also completed the paper self-completion questionnaire. (The data collected from respondents who participated in the Dress Rehearsal has not been included in this deposit).

As was found in the first pilot, each of the four elements (CAPI interview, CASI interview, cognitive assessments and paper self-completion questionnaire) were well received by the participating cohort members. The post-pilot cuts to the core interview were found to be sufficient to have adequately reduced the interview length so it was not necessary to make any further revisions in advance of the main stage.
6. Fieldwork

6.1 Fieldwork period

Fieldwork began in August 2008 and ran until May 2009. The month and year in which respondents were interviewed is included in the deposit (variables: n8intmon and n8intyr).

6.2 Issue of sample and fieldwork waves

The issued sample was comprised of 12,316 cohort members and was issued to the fieldwork contractor in two batches.

The first (and largest batch) was issued in advance of the start of fieldwork and was comprised of 11,707 cohort members who had either:

1) Participated in NCDS6 (2000), NCDS Biomedical Survey (2002) or NCDS7 (2004) and had not subsequently died, emigrated or permanently withdrawn from the study (n=11,320).
2) Not participated in any of the above but had confirmed their address by responding to a birthday card mailing or in some other fashion since 2000 (n=387).

The second batch of sample was issued to the fieldwork contractor in December 2008 and was comprised of 609 previously untraced cases for whom new contact details had been obtained either from a tracing exercise conducted in collaboration with the Department of Work and Pensions (DWP) or a tracing exercise conducted via the National Health Service Central Register.

Sample was subsequently issued to interviewers in 8 overlapping waves. The first batch of sample was issued to the first six waves of fieldwork and the second batch of sample was issued to the seventh wave of fieldwork. A ‘mop-up’ wave ran was conducted towards the end of the fieldwork period which provided a final opportunity to reach those who were difficult to contact in the earlier waves.

6.3 Making contact

In advance of any contact from NatCen, cohort members were sent a pre-notification mailing which advised that the 2008-9 follow-up would soon be starting. The pre-notification mailing was accompanied by a summary report entitled ‘Now we are Fifty’ which provided cohort members with a summary of some of the key findings to have emerged from the study since it began in 1958. The pre-notification mailing was mailed to cohort members in 4 batches:

1) Cases allocated to Waves 1 and 2 were mailed 3-4 weeks in advance of the start of Wave 1 fieldwork.
2) Cases allocated to Waves 3 and 4 were mailed 3-4 weeks in advance of the start of Wave 3 fieldwork.
3) Cases allocated to Waves 5 and 6 were mailed 3-4 weeks in advance of the start of Wave 5 fieldwork.
4) Cases allocated to Wave 7 were mailed 3-4 weeks in advance of the start of Wave 7 fieldwork.

Where pre-notification letters were returned because the cohort member no longer lived at the mailed address these cases were prioritised for tracing by the CLS tracing team.

Each wave of fieldwork was preceded by the mailing of an advance letter which advised cohort members that an interviewer would be calling shortly. Once contact had been established interviewers attempted to arrange appointments to conduct the core interview (CAPI, CASI and cognitive assessments). Paper self-completion questionnaires were then posted to cohort members with a letter confirming the date and time of the appointment, so that in most cases the questionnaire could be collected by the interviewer when they visited the cohort member’s home to conduct the interview.

In cases where interviewers established that a cohort member was no longer living at the issued address they were expected to make reasonable efforts to trace that individual. Interviewer tracing methods included contacting the new occupants of the issued address, contacting ‘stable contacts’ using contact details provided to them and talking to neighbours. Where the interviewer failed to find the cohort member the case was passed back to the CLS tracing team for further investigation.

In the small number of cases where the cohort member was unable to understand or respond to questions put by the interviewer, short proxy interviews were undertaken with a family member or carer.

6.4 Pre-fieldwork tracing

Between follow-ups efforts are made by CLS, through the mailing of an annual birthday card and other activities, to maintain contact with as many members as possible. Prior to fieldwork, the CLS Tracing Team attempted to obtain a current address for as many cohort members as possible.

The methods used by the CLS tracing team in advance of fieldwork include the use of:

- Contact details previously provided by the cohort member (for themselves and for relatives and friends)
- Other information contained in study records
- Telephone number databases
- Postcode databases
• Electoral register databases
• National Health Service Central Register records of NHS registration, emigrations and deaths

In addition to the efforts of the tracing team, a major tracing exercise of cohort members was undertaken in September 2007 in collaboration with the DWP. DWP attempted to match the details of cohort members who had not been contacted for some time against benefit records. Where details of cohort members were matched to DWP records, tracing letters were sent by DWP where an address different to that held by CLS was identified. Those receiving benefits were sent an opt-out letter and those not receiving benefits were sent an opt-in letter.

NCDS cohort members are also ‘flagged’ on the National Health Service Central Register (NHSCR). In advance of fieldwork, CLS also gained the agreement of ONS that tracing letters could be mailed to untraced cohort members via Health Authorities identified on the NHSCR.

Updated address information collected via these two methods was not obtained until after fieldwork had started; previously untraced cases for whom new addresses became available were therefore allocated to Wave 7. If new address information was obtained via DWP or NHSCR tracing for cohort members already issued then these new details were provided to NatCen so that interviewers could use them to help with their tracing efforts.

6.5 Briefing

All interviewers involved in the 2008-9 follow-up attended a one-day briefing in advance of commencing their assignments. The briefings covered the background to the NCDS, contact and tracing procedures, the CAPI and CASI interview, conducting the cognitive assessments, collecting contact information, collecting consents and the use of survey documents.
7. Data coding and editing

The NCDS interview included a number of open-ended questions where the verbatim answers of cohort members were keyed by interviewers, and a rather larger number of questions where precodes are provided for answers but provision is also made to record additional information where the precode ‘other’ is used. Following the start of the survey, these questions were reviewed by the research team (both at NatCen and CLS) to identify the appropriate coding frames.

Where possible, coding frames that had been employed for earlier NCDS surveys were adopted, although it was sometimes necessary to include additional codes. In other instances, it was necessary to develop a coding frame from scratch. Coding was undertaken by NatCen.

A major advantage of the use of CATI is the reduced need for post-fieldwork editing – the majority of checks for validity, range and consistency can be incorporated into the CAPI/CASI program. Inevitably, however, there were checks, which were overlooked, or not initially thought necessary. These checks were incorporated into the DP activities undertaken by NatCen after the survey.

Further details of the editing and coding are to be found in the following, which also accompanies the data deposit: NCDS 2008-2009 Follow-up: Technical Report.

Appendix 3 – Detailed description of the use of unfolding bracket variables

In the benefits section of the family income module, unfolding bracket questions are asked for each of the 21 benefits listed, where: the amount of benefit received (N8IAAnn variables) or the period it was received for (N8IAPnn variables) are unknown (set to -8 or -9). If the cohort member does not give an amount for the benefit, the ‘period it was received for’ question is not asked. Thus the only unfolding bracket questions that get asked are in the ‘ELSE’ section ([IAOB]) for ‘Other Period’. Minimum and maximum benefit amounts per month (MINV and MAXV variables) can be used to estimate the amount of benefit received.

In the income sources section of the family income module, unfolding bracket questions are asked where the amount of income received from the sources listed in the previous month is not known (830 cohort members with variable N8INCSRE set to -8 or -9). Non-missing values of the minimum and maximum unfolding bracket variables (N8INCSMN and N8INCSMX) can be used to estimate the previous months income from the sources listed.

In the savings section of the family income module, unfolding bracket questions are asked where the total amount of savings is not known (1760 cohort members with variable N8SAVTOT set to -8 or -9). Non-missing values of the minimum and maximum unfolding bracket variables (N8SAVTMN and N8SAVTMX) can be used to estimate the total amount of savings.

In the employee net pay section of the employment module, unfolding bracket questions are asked where the amount of net pay or the period covered is not known (402 cohort members with variables N8CNETPY/N8CNETPD set to -8 or -9 or N8CNETPD =6 (other period after backcoding from text). Depending on the value for the period variable (week/fortnight/month/year/other period) the relevant set of unfolding bracket questions are asked and non-missing values for minimum and maximum amount (MINV and MAXV variables) can be used to estimate the cohort members weekly amount of net pay. The computed weekly amount variable, N8CNETWK, is set to -8 (don’t know) for these cohort members.

In the employee gross pay section of the employment module, unfolding bracket questions are asked where the amount of gross pay or the period covered is not known or some other period is specified (861 cohort members with variables N8CGROPY/N8CGROPD set to -8 or -9 or N8CGROPD=6). Depending on the value for the period variable (week/fortnight/month/year/other period) the relevant set of unfolding bracket questions are asked and non-missing values for minimum and maximum amount (MINV and MAXV variables) can be used to estimate the cohort members weekly amount of net pay. The computed weekly amount variable, N8CGROWK, is set to -8 (don’t know) for these cohort members.

In the self-employed net profit section of the employment module, unfolding bracket questions are asked where the amount of net profit is not known (244 cohort members with variable N8SEPRIT=-8,-9). Non-missing values of the minimum and maximum unfolding bracket variables (N8SEPRMN and N8SEPRMX) can be used to estimate the total amount of self-employed net profit.

In the self-employed earnings section of the employment module, unfolding bracket questions are asked where the amount of self-employed earning is not known (360 cohort members with variable N8SEEARN=-8,-9). Non-missing values of the minimum and maximum unfolding bracket variables (N8SEPRMN and N8SEPRMX) can be used to estimate the total amount of self-employed net profit.

In the other job income section of the employment module, unfolding bracket questions are asked where the amount of take-home pay for odd jobs etc is not known (59 cohort members with
variable N8OJNETW=8,-9). Non-missing values of the minimum and maximum unfolding bracket variables (N8OJNEMN and N8OJNEMX) can be used to estimate the total amount of other job income.

In the CM partner’s net pay section of the partner’s job module, unfolding bracket questions are asked where the amount of partner’s net pay or the period covered is not known (1661 cohort members with variables N8PNETPY/N8PNETPD set to -8 or -9). Depending on the value for the period variable (week/fortnight/month/year/other period) the relevant set of unfolding bracket questions are asked and non-missing values for minimum and maximum amount (MINV and MAXV variables) can be used to estimate the cohort members weekly amount of net pay. The computed weekly amount variable, N8PNETWK, is set to -8 (don’t know) for these cohort members.
