The Centre for Longitudinal Studies (CLS) is an ESRC Resource Centre based at the Institution of Education. It provides support and facilities for those using the three internationally-renowned birth cohort studies: the National Child Development Study (1958), the 1970 British Cohort Study and the Millennium Cohort Study (2000). CLS conducts research using the birth cohort study data, with a special interest in family life and parenting, family economics, youth life course transitions and basic skills.

The views expressed in this work are those of the author and do not necessarily reflect the views of the Economic and Social Research Council. All errors and omissions remain those of the author.

Introduction

The Millennium Cohort Study (MCS) is a multi-disciplinary, multi-purpose research project following the lives of more than 19,000 children born in the UK in 2000-01. It is the most recent of Britain's world-renowned national longitudinal birth cohort studies. The study has been tracking the Millennium children through their early childhood years and plans to follow them into adulthood. As with any longitudinal survey, the MCS is subject to attrition. Attrition takes place when respondents drop out of the survey over time. This leads to two problems: a reduction in sample size and to bias in sample composition. Sample bias arises when the likelihood of dropping out from the survey is correlated with the socio-demographic characteristics of the respondents. In this case, the survey will lose a particular type of respondent (e.g. disadvantaged families, ethnic minorities, etc) and the sample will no longer be representative of the original population.

This report explores attrition in sweep 5 (age 11) of MCS and presents the procedures used in the construction of the sweep 5 unit non-response weights. For a full description of attrition in previous waves, refer to the MCS <u>Technical Report on Response</u> (3rd edition, 2010). For a description of how to use the weights in Stata and SPSS refer to the respective guides (<u>Stata, SPSS</u>). For a description of the MCS sample refer to the <u>Technical Report on Sampling</u> (4th edition, 2007).

Response at sweep five (MCS5)

In table 1, response and non-response rates are presented by category. The table shows that the proportion of productive cases dropped over time from 96.4 per cent in MCS1 to 69 per cent in MCS5. The proportions in all other categories rose as the proportion of non-respondents grew.

Ineligible includes child deaths, sensitive cases and temporary and permanent emigrants. *Untraced* refers to untraced movers and may include emigrants.

| Categories | MC | S1 | MCS2 | | MCS3 | | MCS4 | | MCS5 | |
|--------------------|--------|-------|--------|-------|--------|-------|--------|-------|--------|-------|
| | Freq. | % |
| Not issued | 692 | 3.6 | 0 | 0.0 | 0 | 0.0 | 2,213 | 11.5 | 2,851 | 14.8 |
| Productive | 18,552 | 96.4 | 15,590 | 81.0 | 15,246 | 79.2 | 13,857 | 72.0 | 13,287 | 69.0 |
| Ineligible | 0 | 0.0 | 167 | 0.9 | 300 | 1.6 | 126 | 0.7 | 78 | 0.4 |
| Untraced | 0 | 0.0 | 687 | 3.6 | 547 | 2.8 | 706 | 3.7 | 388 | 2.0 |
| Refusal | 0 | 0.0 | 1,739 | 9.0 | 2,315 | 12.0 | 1,811 | 9.4 | 2,196 | 11.4 |
| Non-contact | 0 | 0.0 | 930 | 4.8 | 546 | 2.8 | 123 | 0.6 | 438 | 2.3 |
| Other unproductive | 0 | 0.0 | 131 | 0.7 | 290 | 1.5 | 408 | 2.1 | 6 | 0.0 |
| Total | 19,244 | 100.0 | 19,244 | 100.0 | 19,244 | 100.0 | 19,244 | 100.0 | 19,244 | 100.0 |

Table 1: Response rates in all MCS sweeps

Table 2 shows that response rates were very similar across all four countries, with the highest response rate being in England.

| Categories | England | | Wales | | Scotland | | NI | |
|-----------------------|---------|-------|-------|-------|----------|-------|-------|-------|
| | Freq. | % | Freq. | % | Freq. | % | Freq. | % |
| Not issued | 1,761 | 14.4 | 365 | 13.2 | 414 | 17.7 | 311 | 16.2 |
| Productive | 8,618 | 70.5 | 1,881 | 68.2 | 1,480 | 63.4 | 1,308 | 68.0 |
| Ineligible | 53 | 0.4 | 9 | 0.3 | 10 | 0.4 | 6 | 0.3 |
| Untraced | 200 | 1.6 | 75 | 2.7 | 84 | 3.6 | 29 | 1.5 |
| Refusal | 1,309 | 10.7 | 335 | 12.1 | 306 | 13.1 | 246 | 12.8 |
| Non-contact | 279 | 2.3 | 95 | 3.4 | 42 | 1.8 | 22 | 1.1 |
| Other unproductive | 5 | 0.0 | 0 | 0.0 | 0 | 0.0 | 1 | 0.1 |
| Total | 12,395 | 100.0 | 2,798 | 100.0 | 2,370 | 100.0 | 1,955 | 100.0 |

Table 2: Response rates by country in MCS5

Table 3 shows that the response rates vary across ward types within country. Advantaged households systematically have higher response rates than disadvantaged ones while the ethnic stratum in England has a relatively high response rate.

Table 3: Response rates by stratum in MCS5

| Categories | England | | | Wa | ales Scotla | | land | and NI | |
|--------------|---------|------|-------|------|-------------|------|------|--------|------|
| | Adv. | Dis. | Ethn. | Adv. | Dis. | Adv. | Dis. | Adv. | Dis. |
| Unproductive | 25.5 | 31.0 | 34.2 | 28.3 | 33.4 | 32.4 | 40.7 | 30.8 | 32.7 |
| Productive | 74.5 | 69.0 | 65.8 | 71.7 | 66.6 | 67.6 | 59.3 | 68.2 | 67.3 |

(Adv: Advantaged ward. Dis: Disadvantaged ward. Ethn: Ethnic minority ward)

Table 4 shows that 54.3 per cent of all respondents participated in all waves of MCS. In contrast, 19.6 per cent have interrupted response patterns. In other words, they participated in a number of waves then dropped out before participating again in subsequent waves. 26.1 per cent of all respondents have monotone response patterns. That is, they participated in a number of waves before dropping out for all subsequent sweeps.

| Table 4: Monotone vs. non-monotone response in I | MCS5 |
|--|------|
|--|------|

| Type of non-response | Freq. | % |
|----------------------|--------|-------|
| Monotone | 5,023 | 26.1 |
| Non-monotone | 3,773 | 19.6 |
| All waves | 10,448 | 54.3 |
| Total | 19,244 | 100.0 |

Predicting response at wave 5 for weight adjustment

The same procedure used for predicting non-response at wave 4 was again used at wave 5. Missing data for predictor variables due to non-monotone non-response or item missingness were imputed using simple and multiple imputations. Wave 5 non-response predictors were mostly the same as at wave 4. Multiple imputations were carried out using the MI command in Stata 12.

As a result of the use of simple and multiple imputations, the sample used in the logit response model consisted of 16,393 observations (i.e. the issued sample in MCS5). Weights were constructed for all respondents in MCS5. The dependent variable in the logit model is binary (1 for response and 0 otherwise) and the predictors are: the cohort member's gender; mother's age at first live birth; ethnicity; housing tenure; accommodation type; national vocational qualification; breastfeeding; main respondent's work status; whether the household is a new family which joined the survey in wave 2; and income item non-response. These variables came from all four previous waves.

Imputations were carried out in the following way:

Simple imputations: ethnicity, accommodation type and National Vocational Qualification (NVQ) were imputed using the most recent available data from previous waves with simple replacement imputations. The questions on accommodation type and NVQ were only asked if accommodation or NVQ have changed since the last wave of data collection.

Multiple imputations: main respondent's work status and housing tenure were missing for 2,744 observations. Breastfeeding was missing for the new families (617 observations). These three variables were imputed using 10 multiple imputations. Different imputation procedures were used depending on the nature of the variable: a logit procedure for work status and breastfeeding and a multinomial logit for housing tenure. The explanatory variables for the imputation of work status and housing tenure in wave 4 were the exact same variables from the previous three sweeps. For the imputation of breastfeeding I used different variables related to social class as explanatory variables: ethnicity; NVQ; number of parents in household; and type of accommodation.

It should be noted that some variables such as cohort member's gender and whether the household is a new family did not have any missing values and therefore did not require any imputation. Income item non response was constructed as a binary variable which takes the value of 1 if the respondent did not answer the income question. Mother's age at first live birth was missing for only 49 observations; these were replaced by the average age of the non-missing cases.

Table 5 shows the odds ratios of the response logit model estimated using the 10 imputed datasets. The linear predicted values were generated from this model then an inverse-logit transformation was carried out to transform the predicted values into predicted probabilities. The non-response weights at sweep 5 were constructed as the inverse of the predicted probabilities. Two overall weights were constructed by multiplying the aforementioned non-response weights with the same weights from wave 4. These overall weights adjust for both sampling and attrition. The weights are:

- EOVWT1: wave 5 overall weight for single country analysis
- EOVWT2: wave 5 overall weight for whole of UK analysis.

Table 5:logit response model

| Explanatory variables | Odds Ratio | Std. Err. | t-statistic | P>t |
